Invalidenstrasse 42 - the office of the institute

Dear colleagues,
members and students of the Institute of Biology,

I am very grateful to those in the institute taking initiative in preparing this brochure. The brochure increases the visibility of the institute both within and outside the university by providing an outline of the diverse scientific activities of the Institute of Biology at our university.

Our institute is one of the most competitive and highest performing institutes within the Humboldt-Universität zu Berlin. Our level of extramural funding ranks highest among all institutes, and we compete nationally with the best. We actively participate in German Research Foundation-sponsored clusters of excellence, collaborative research centers, often providing the speaker of the consortium, graduate schools, priority programs and research units, and with numerous individual projects. This success is particularly impressive considering a dramatically increased number of students and the insufficient financing of our university. In spite of the continuously decreasing teacher-to-student ratio, the Institute of Biology has maintained its focus on experimental and practical instruction for all students.

Turning to current and prospective students interested in studying biology, I encourage you to use this brochure as an overview of the institute's activities in education and research. I hope that the information provided here will be a stimulus for the decision of prospective students to begin and/or continue their studies at the Humboldt-Universität zu Berlin.

In the past two years we have been integrating our institute into the new Faculty of Life Sciences. The Institute of Biology together with agricultural and horticultural sciences as well as the Institute of Psychology, is now in a position to benefit from the new possibilities for interdisciplinary research and teaching.

I extend, again, my thanks to all those who have participated in the preparation and implementation of this brochure. To the managing directory and the Council of the Institute of Biology, to all members of our university, who are supporting our efforts, and particularly to all members of the Institute of Biology, I sincerely wish continued success and gratification in all teaching and research activities.

Bernhard Grimm
Dean of the Faculty of Life Sciences

Dear Readers,

This brochure presents a brief overview of the science being conducted in Institute of Biology.

We hope that it provides an insight into the biological research at the Humboldt-Universität zu Berlin, with our goal being to inform interested readers, ranging from colleagues and students to the informed public about the research that we conduct.

This presentation is meant only to be a snapshot rather than a comprehensive catalogue of our work. Research is by nature dynamic and ever changing. We would be delighted if this brief insight would spark the interest of the reader and initiate contacts leading to a deeper understanding of the life sciences. We especially encourage students, to take this opportunity to step outside the lecture hall and become acquainted with the breadth of scientific research in our institute.

This brochure mirrors the diverse research topics and methods employed by our scientists. This diversity describes our research more accurately than a simple listing of the scientific disciplines found in the institute. Irrespective of the scientific questions under investigation, our research as a whole reflects a common interest in uncovering the multifaceted complexity of life. We are proud that our institution is internationally recognized at the highest level and that the Institute of Biology has played an important role in raising the Humboldt-Universität zu Berlin to the status of a university of excellence.

I wish everyone an enjoyable experience discovering the diversity of our institute.

Michael Brecht
Managing Director of the Institute of Biology

History of biology – a brief review of institutes and disciplines

When the University of Berlin was founded in 1810, chairs in biology were set up, which drew on the tradition of different pre-university institutions: the Prussian Society (1700) or Academy (1744) of Sciences with its Botanical Gardens at Schöneberg, first mentioned in 1679, the “Theatrum anatomicum” from 1713 and the “Naturalienkabinett” founded in 1716. Other important biological collections originated from the public “Collegium medico-chirurgicum” (1723) and the Berlin Society of Naturalists (“Gesellschaft naturforschender Freunde zu Berlin”, 1773). The first biologists of the university, the botanist Carl Ludwig WILLDENOW (1765-1812) and the zoologist Hinrich LICHTENSTEIN (1780-1857) were closely connected with these organizations.

The chairs of botany and zoology were established in the Faculty of Philosophy, independent of each other and of medicine, already in 1810 – a very progressive idea at a time when both disciplines were generally regarded as medical domains or combined in a single “philosophical” chair for natural history. Heinrich LINK (1767–1851), who succeeded WILLDENOW in 1815, re-integrated botany temporarily into the Faculty of Medicine, while the botanists Friedrich Gottlob HAYNE (1763-1832) and Carl Sigismund KUNTH (1788-1850) held the original position. KUNTH and LINK were followed by Alexander BRAUN (1805-1877) in 1851. In the era of BRAUN and Wilhelm PETERS (1815–1883), who replaced LICHTENSTEIN in 1858, botany and zoology developed on a large scale. By 1880 comparative anatomy and morphology, systematics, biogeography, floristics, and faunistics were flourishing and had initiated great expeditions. Julius MEYEN (1804-1840), Hermann SCHACHT (1814-1864) or Robert CASPARY (1818-1887) as well as Christian Gottfried

The first biologists of the Berlin University, the zoologist Hinrich LICHTENSTEIN (copper plate before 1822) and the botanist Carl Ludwig WILLDENOW (copper plate 1802), (picture archives of the author).

EHRENBERG (1795-1876) had done pioneer work in microscopy, whereas Hermann KARSTEN (1819-1908), Nathanael PRINGSHEIM (1823-1894) or Leopold KNY (1841-1916) were already working in plant physiology. The advancing differentiation of biological topics led to the introduction of independent chairs for general and systematic botany (1878) and zoology (1884). This development reached most universities only more than 70 years later!

The first professors for systematic botany August Wilhelm EICHLER (1839-1887) well-known for his flower-diagrams and, in particular, Adolf ENGLER (1844-1930) opened the golden age of plant taxonomy and geography in Berlin. ENGLER transferred the Botanical Gardens from Schöneberg to Dahlem (1898-1904). A new Botanical Museum followed (1906). In 1921, Ludwig DIELS (1874-1945) succeeded ENGLER.

In general botany, microscopic studies dominated research for a long time. The first chair-holder Simon SCHWENDENER (1829-1919), who came to Berlin in 1878, and his successor (1910) Gottlieb HABERLANDT (1854-1945) founded physiological plant anatomy combining structural and functional re-

search. A new and modern Plant Physiological Institute was built at Dahlem in 1913 where HABERLANDT formulated one of the first hormone theories in botany. In 1924 Hans KNIEP (1881-1930), an expert for the life cycles of fungi, was appointed. Kurt NOACK (1888-1963), who held the position from 1931 to 1956, became a pioneer of plant biochemistry.

Zoological anatomy and physiology especially rooted in the Faculty of Medicine where Karl Asmund RUDOLPHI (1771-1832), Johannes MÜLLER (1801-1858) and Karl REICHERT (1811-1883) lectured, and Oscar HERTWIG (1849-1922) set up a special “Anatomical-biological Institute” (1892). MÜLLER had created one of the most influential schools of scientific zoology with such distinguished graduates as the co-founder of the cell theory Theodor SCHWANN (1810-1882), the pioneer of electrophysiology Emil DUBOIS-REYMOND (1818-1892) and Ernst HAECKEL (1834-1919).

A new chapter in the history of zoology at Berlin commenced in 1884 when Franz Eilhard SCHULZE (1840-1921) constituted a Zoological Institute and Karl MÖBIUS (1825–1908) got a second chair (1888) as the head of the Zoological Museum. Both institutions were housed in the new Museum for Natural History (1888) and developed to centres of morphological, systematic and geographical research. At the end of the 19th century comparative morphological studies turned to development-physiological and cytological experiments and phylogenetic considerations – the main topics of HERTWIG and Karl HEIDER (1856-1935) who followed SCHULZE in 1917. After a period of zoogeography and ecology, the research fields of Richard HESSE (1868-1944), who directed the Zoological Institute from 1926 to 1935, Friedrich SEIDEL (1897-1992) again preferred development-physiological themes. The institute repeatedly brought forth leading zoologists with new concepts, such as proto-zoology by Fritz SCHAUDINN (1871-1906) or comparative and experimental sensory physiology and behavioural biology by Hansjochem AUTRUM (1907-2003), Erich VON HOLST (1908-1962) and Günter TEMBROCK (1918-2011), respectively.

Throughout the 19th century the Zoological Museum had only three directors. After MÖBIUS retired in 1905, the position was held by August BRAUER (1863-1917), Willy KÜKENTHAL (1861-1922), Carl ZIMMER (1873-1950) and Hanns VON LENGERKEN (1899-1966). They extended the building, reorganized the collections and exhibitions and were supported by a rising number of custodians, among them famous specialists like the spongiologist Walther ARNDT (1891-1944) who was murdered by the Nazi regime, the mammal-expert Hermann POHLE (1892-1982) or the ornithologist Erwin STRESEMANN (1889-1972).

The post-war reconstruction and revival of the Berlin University was soon affected adversely by the beginning East-West conflict. The biological institutes suffered particularly. By 1949, the Humboldt-University had lost all its botanical institutions in Dahlem, a West-Berlin district. An Institute for General Botany directed by the plant physiologist Konrad RAMSHORN (1909-1978) and an Institute for Special Botany headed by the taxonomist Walter VENT (1920-2008) were re-established in 1960. The general botanists were accommodated at disperse zoological, agricultural and veterinary departments, whereas the special botanists settled at the arboretum of the former Späth company at Baumschulenweg.

The zoologists maintained their traditional buildings, but met severe personnel problems when the new chair-holders at the Zoological Museum and Institute, Werner ULRICH (1900-1977) and Konrad HERTER (1891-1980), moved to the Free University in Dahlem. The situation of the museum consolidated, when in 1951 the taxonomist Alfred KAESTNER (1901-1971), and then, after the deep cut of the Berlin Wall in 1961, the evolutionary biologist Konrad SENGLAUB (* 1926) were appointed, while the Zoological Institute went through a long phase of temporary solutions until the morphologist and cell biologist Kurt ERDMANN (1907-1980) could be won in 1958.

In 1968 the historically grown institutes were united in a "Section of Biology" with different divisions. Although training plant physiology became a priority, behavioural biology, biophysics, biochemistry, genetics and ecology were important fields.

When Germany was reunited in 1990, these directions formed the foundations of the Institute for Biology, as it was named in 1994. Chairs in microbiology, physiology of microorganisms, biochemistry of plants, cytology, molecular cell biology and molecular parasitology were added reflecting the impact of modern concepts. Animal physiology, behavioural physiology, sensory physiology as well as applied botany and comparative biology are represented in the institute by groups engaged in active research.

The close contacts to the nearby Museum of Natural History is one of the major advantages linking wealth of knowledge in systematic biology and the invaluable collection at this site to programs in research and education. In 1995, an "Innovationskolleg" for theoretical biology was founded and its three groups add another unique and attractive asset to the department.

Figures 3, 4, and 5
The botanist Kurt NOACK (photo 1953), the zoologist Kurt ERDMANN (photo about 1960) and the geneticist Ursula NÜRNBERG (photo 1966) led the Branch of Biology after 1945 and contributed substantially to revive and stabilize the field at Humboldt University in a critical time (picture archives of the author).

THE FOUNDATION OF THE UNIVERSITY

The Humboldt-Universität zu Berlin was founded in 1810 and is considered the “mother of all modern universities“. This reputation is thanks to the university concept established by the scholar and statesman Wilhelm von Humboldt.¹ In February 1809, he took responsibility for education and training in the Ministry of the Interior. He made an application to the King to found the University of Berlin, on July 24, 1809: “The department dares, to apply respectfully to his Royal Majesty:

1. To set up a plan for the establishment of a university in Berlin, that should take the already-extant scientific institutes and museums in Berlin, the Medical Academy, and the Academy of Sciences and Arts, and unify them under the aegis of the department for education and training. And to proceed at once to execution of the plan, as soon as the administration of the necessary revenues will be possible“.² From 1828, the University of Berlin was named Friedrich-Wilhelms-University, after its founder, the Prussian king Friedrich Wilhelm III.

THE SINGLE-CELLED ORGANISM FROM NORTH CAMPUS

In the new research building of the Institute of Biology, the “Green Amoeba“, seven working groups are cooperating, surrounded by the historic campus.

The North Campus is always worth visiting. Many Berliners know that an architectural and landscape-gardening gem is hidden in the center of Berlin. Now a new building is located on the site of the former Faculty of Veterinary Medicine: the “Green Amoeba“. This is what the biologists lovingly call their new research and laboratory building on Philippstraße, which is officially known as the Rhoda-Erdmann-Haus and was formally inaugurated on 11 October 2016.

The nickname is no accident. The building has an amorphous shape, and its metal façade includes three different shades of green. “We all feel very comfortable here. I think the building has character and it differs in a good way from the many gray research buildings, which are functional but not very attractive,“ says Christian Schmitz-Linneweber, a Professor of Molecular Genetics who has moved into the new building with his working group. A total of seven research groups are conducting research on molecular and cell biology here, alongside two junior research groups from the Institute of Biology.

Another peculiarity of the house is that the roof houses no technology. As the building is a protected monument, the huge cooling plants were banished to the basement. There are also different culture rooms for growing the bacteria, yeasts and plants that the scientists need for their work. A bright spot is the atrium, which features public art. The work of Kathrin Wegemann extends over three floors and symbolizes a loose cluster of cells. The large, black spots change color as temperatures fluctuate. Additionally, the building will house a sculpture of its patron, Rhoda Erdmann.

The new building, designed by the Stuttgart-based architecture firm BodamerFaber and financed and built by the Federal State of Berlin, enabled the Humboldt University to vacate a building at Chausseestraße 117, thereby eliminating high rental payments. “We used to work in a third back courtyard, which no one else ever ventured into. Now we are more centrally located and rub shoulders with other working groups,“ reports Schmitz-Linneweber.

The object of the construction planning was not only the new building, but also an adjacent historical building, which once served as a horse clinic and is now prosaically called “Haus 9“. The northern part was built in 1836 by Ludwig Ferdinand Hesse as a medical horse clinic; the southern part in 1874 by Julius Emmerich as an extension of the horse clinic. The building had to be gutted from the ground up. Only the historical façades remain and have been restored according to the specifications for monument preservation. “Haus 9“ is the realm of students. On the ground floor are five rooms with work spaces for trainees. The attic, which had to be completely replaced due to its poor condition, accommodates lounges and workplaces for students. The new roof was financed by the university - the Senate building measure did not provide for the reconstruction.

The façade design of the “Green Amoeba“ is a counterpoint to the many clinker façades on North Campus. “On the site, three architectural styles are particularly striking: early and late classicism and modernism,“ says Theodor Hiepe, a connoisseur of the campus. He held the Chair of Parasitology from 1961 to 1995 and has been conducting research on site for over 55 years.

The jewel of the property is unquestionably the anatomical theatre for animals - designed by Carl Gotthard Langhans at the same time as the Brandenburg Gate. “At first, the dome was built on a gentle hill, which has meanwhile completely disappeared through the construction activities all around,“ reports Hiepe. The building in the early classical style was inaugurated in 1790 on the occasion of the foundation of the Royal Veterinary School.

Under the pressure of animal diseases and the mass death of cattle and horses during the Seven Years’ War, and ultimately for reasons of competition – since veterinary schools had already been established in Lyon, Alfort, Vienna and Dresden - King Friedrich II commissioned the establishment of a school of animal medicine. Friedrich’s personal physician, Christian Andreas Cothenius, was entrusted with the preparation of the concept, structure and function of a veterinary medical and research institute. For financial reasons, Cothenius’s plans could not be realized immediately. The construction was then carried out under Friedrich Wilhelm II.

The Reuß Garden, a nine-hectare plot of land then situated just outside Berlin's north-western city gate, was selected as the site.

Since the beginnings of the veterinary school, much water has flowed through the South Panke River (it is also dry at times), which winds its way through the garden from north to south. The clinic, institute, stable and residential buildings were built and partly demolished again. Despite rapid urban development, the garden area, including its historical paths, has been preserved largely intact until today.

In addition to the Langhans and Gerlach buildings, the latter of which is currently under restoration, a further building constructed according to the plans of a famous Berlin architect, Karl Friedrich Schinkel, is located on the protected site. The three-winged classicist construction with its court of honor at Luisenstraße 56 was built by Ludwig Ferdinand Hesse in 1840 on the occasion of the 50th anniversary of the veterinary school. The main building of the veterinary school served as a place to study and live. On the protruding center piece there are six medallions with modeled heads in two rows. "These are the twelve apostles of animal medicine, famous veterinarians or supporters of animal welfare, including Aristotle as a symbolic figure," explains Hiepe.

The main building on Luisenstraße was used during GDR times by the Ministry of Foreign Affairs, and later by other state institutions. A one-meter high wall separated the building on the garden side from the Faculty of Veterinary Medicine. The moment of reconquest arrived in January 1990. "Scientists and students had occupied the building and reclaimed it," Hiepe recalls of the time when his position changed from dean to squatter. The story had a happy ending when the building was returned to the Humboldt University in June on the occasion of the 200th anniversary of the faculty. The Faculty of Veterinary Medicine, however, was merged with the Free University, contrary to the recommendations of the Berlin Science Council, and integrated into it.

Today, the HU's Faculty of Life Sciences, including the Institute of Biology, is located on North Campus, and also cooperates with the Charité. This interaction has historical roots. "During the period of the Royal Veterinary Faculty from 1887 to 1934, both institutions worked closely together and established comparative medicine worldwide." The fact that the bounda-

ries between human and animal medicine were fluid is also shown by the fact that the Institute of Pathology for Animal Medicine, "Haus 14", was built from 1882 to 1884 on the initiative of the physician and pathologist Rudolf Virchow.

Another building should not go unmentioned: the modest "Haus 10" represents modernism. It was built in the Bauhaus style in the 1920s. This was the site of the pharmacy and the training forge. The building is located in the immediate vicinity of "Haus 22", the Rhoda Erdmann Building.

WHO WAS RHODA ERDMANN?

The new research building of the Institute of Biology is named after the scientist Rhoda Erdmann (1870 - 1935), a biologist, cell researcher and co-founder of experimental cell biology in Germany. From 1903 to 1908 she studied zoology, botany and mathematics at the universities of Berlin, Zurich, Marburg and Munich. She was one of the first female doctoral students in Germany, where women were officially allowed to study after 1900. After graduation, she worked with Robert Koch at the Institute for Infectious Diseases.

Due to the poor working conditions for female scientists in Germany, she immigrated to the US in 1913 and initially worked at the Rockefeller Institute in New York, then at Yale University in New Haven. She returned to Berlin in 1919 and habilitated on 28 July 1920 as the second woman in zoology at the Faculty of Philosophy at the University of Berlin. In 1923 she moved to the Faculty of Medicine, where she was appointed an associated staff professor in 1929. She was the first woman to lead a scientific institute, the "Institute for Experimental Cell Research".

In 1925 Rhoda Erdmann founded the journal "Archive for Experimental Cell Research", which she edited until her death. In addition, she was involved in the founding of the international Society for Experimental Cytology and three congresses.

In the spring of 1933 she was denounced and imprisoned by the Gestapo for two weeks. It was only thanks to international protests, including from the US, that she was released relatively quickly. Several of her students had to emigrate; she was forced to retire and to leave her institute.

She died after a long illness on 23 August 1935. Her international recognition is emphasized in an obituary in "Nature" (No. 136, Oct. 1935).

Source: Wikipedia, Mrs. Annette Vogt.

The artist Anna Franziska Schwarzbach, who created the bust of Rhoda Erdmann, at its unveiling. Photo: Ralph Bergel

The Rhoda-Erdmann bust, created by the Berlin artist Anna Franziska Schwarzbach, was unveiled on the 5th of July 2017 in the Rhoda Erdmann Building of the Faculty of Life Sciences at the Humboldt-Universität zu Berlin (HU).

Schwarzbach emphasized: "I am always fascinated by the clarity, the perseverance, the patience and the sincerity with which women like Rhoda Erdmann have made their way in a male-dominated environment. Their paths are full of obstacles, yet they continue undaunted. Rhoda Erdmann's courage, her upright attitude, her civil courage are exemplary."

Rhoda Erdmann (1870-1935) was one of the first female professors at the University of Berlin. In 1924, she was appointed as an extraordinary professor without tenure, and in 1929 she became a tenured extraordinary professor. She endured a difficult journey to recognition for her extraordinary work as a scientist. She is one of the founders of modern cell biology, wrote textbooks, was the founder and editor of the international journal "Archive for Experimental Cell Research". She was founder of the Association of German University Students and general secretary of the International Society for Experimental Cytology, an organisation which she also co-founded, until her death at the age of 64.

Schwarzbach previously won the competition for the Lise-Meitner memorial in the HU courtyard of honour. With the unveiling of the Rhoda-Erdmann bust, we honour another outstanding scientist from the Humboldt-Universität zu Berlin.

Biophysics

FRANZ BARTL

Biophysical chemistry

https://www.biologie.hu-berlin.de/de/gruppen/biophyschem_portal/

Description of the projects:

The topic of the research group “Biophysical Chemistry“ is the investigation of reaction mechanisms of various photoreceptors with spectroscopic methods, particularly with UV/Vis and static and time resolved FTIR spectroscopy in the time range from ns to seconds. In order to improve the spectroscopic performance we also develop new advanced spectroscopic techniques.

We focus on three types of photoreceptors: Vertebrate rhodopsin, channelrhodopsins and phytochromes. In the case of vertebrate rhodopsin we concentrate on the light induced activation and deactivation and on the mechanism of G-protein binding, since many severe eye diseases are linked to deviations in these processes caused by mutations of the receptor.

Channelrhodopsins are light-gated ion channels that are widely used in optogenetics, since they allow the precise control of neuronal activity by light.

Phytochromes are photoreceptors in plants and bacteria. They are bimodal photoswitches that control important physiological processes such as flowering, greening and seed germination with the potential to control cellular processes by light. An exact understanding of the reaction mechanisms of channelrhodopsins and phytochromes on a molecular level is of utmost biological and medical relevance and the prerequisite for a specific design for optimized optogenetic tools and broader applications.

A: FTIR difference spectrum of light induced rhodopsin activation. We use this technique to identify proton transfer reactions and related structural changes that occur during rhodopsin activation mediated by microswitch domains (B), specific amino acid residues that play an essential role in photocycle of channelrhodopsin (C) and protonation dynamics in the chromophore binding pocket of phytochromes (D).

Contribution to research networks

Collaborative Research Center (CRC)1078:

Proteins are key players for many physiological processes such as mass transport, immune defense, blood clotting and communication between cells and environment. Thus the exact knowledge of protein function is of direct biological and medical relevance. Some established aspects of protein function are the key lock principal, substrate binding induced fit and protein- cofactor interactions. The central research goal of the SFB 1078 is to identify and understand a new key principal in protein science, namely the control and coordination of complex protein function by protonation dynamics. In this CRC (Project B05) we investigate the function of channelrhodopsins and phytochrome on a molecular level by UV/ Vis and FTIR difference spectroscopy.

BMBF Project: Single-Shot-Spectrometer for time-resolved simultaneous Vis and IR measurements (BMBF ist 05K16KH1). The aim of this project is the set-up of a novel end-station at the IRIS-beamline of BESSY II for simultaneous, microsecond time-resolved infrared (IR)- and UV/ Vis spectroscopy of non-cyclic or slow-cycling systems. Such measurements are extremely difficult in the IR region since existing techniques for timescales of few ms or below require that the systems to be investigated are strictly cyclic with a fast photocycle, which is not the case, for example, for vertebrate rhodopsin or several channelrhodopsin mutants. The setup uses the unique properties of synchrotron radiation in combination with modern focal-plane array detectors to achieve a so far unreached performance for Single-Shot measurements.

Biophysics

ATHINA ZOUNI

Biophysics of the photosynthesis

<https://www.biologie.hu-berlin.de/de/gruppenseiten/photobiophys>

Description of the projects:

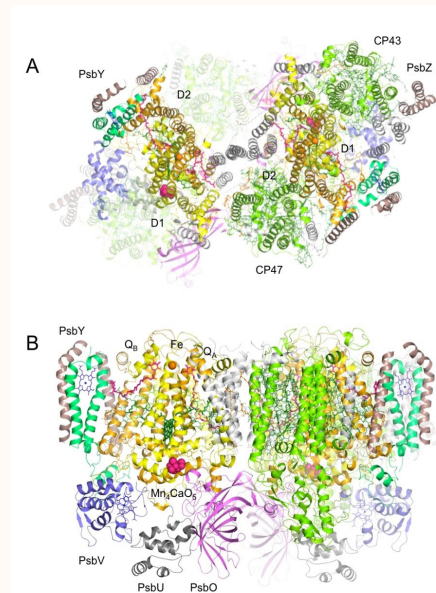

The base for oxygen photosynthesis in green plants, algae and cyanobacteria are two major membrane protein complexes, photosystem I (PSI) and photosystem II (PSII), which are built up of numerous subunits. The oxygen in the atmosphere is produced by a light-induced oxidation of water in PSII. The water oxidizing complex (WOC), which holds a Mn_4CaO_5 -cluster, is catalyzing the reaction: $2 H_2O \rightarrow O_2 + 4 e^- + 4 H^+$. Our main objective is the determination of the mechanism of the water splitting in PSII (fig. 1). This requires the identification of the substrate-water-molecules as well as the amino acid side chains and their protonation status in defined oxidation states of the WOC. This project includes the following fields: i) growing of PSII-crystals, ii) X-ray diffraction measurements of PSII-crystals (Dobbek, HU Berlin) at the synchrotron (BESSY), iii) Dynamic X-ray diffraction measurements:

Selected publications:

Hellmich, J., Bommer, M., Burkhardt, A., Ibrahim, M., Kern, J., Meents, A., Müh, F., Dobbek, H., and Zouni, A. (2014). Native-like Photosystem II Superstructure at 2.44 Å Resolution through Detergent Extraction from the Protein Crystal. *Structure* 22, 1607-1615.

Ibrahim, M., Chatterjee, R., Hellmich, J., Tran, R., Bommer, M., Yachandra, V.K., Yano, J., Kern, J., and Zouni, A. (2015). Improvements in serial femtosecond crystallography of photosystem II by optimizing crystal uniformity using microseeding procedures. *Struct. Dyn.* 2, 041705.

these consist of femtosecond time resolution using a free (space) electron laser and simultaneous measurement of the oxidation status of Mn - ions in the Mn_4CaO_5 -cluster with X-ray emission spectroscopy (Stanford, USA), as well as iv) examination of the protons at the WOC achieved through neutron diffraction measurements in macrocrystals (Oak Ridge, USA).

Architecture of *T. elongatus* dPSIIcc. (a/b) Each monomer of the dPSIIcc consists of 17 transmembrane (a) and 3 membrane extrinsic (b - bottom) subunits. a) View from the cytoplasmic side. The subunits D1 (yellow) and D2 (orange) contain the oxygen evolving center (Mn_4CaO_5 cluster, magenta), special pair chlorophyll a ligands (green), non heme iron (orange) and a fixed and mobile plastoquinone (QA and QB, pink), the latter being the terminal electron carrier. A number of associated subunits (e.g. PsbY) often contain just a single transmembrane helix. D1/D2 are enclosed by the light harvesting subunits CP43 and CP47 (green, faded green in the left monomer). b) View from the membrane side. CP43 and CP47 are omitted from view in the left monomer. Additional membrane extrinsic subunits on the luminal side: The cluster-stabilizing PsbO (pink), cytochrome c-550 (PsbV, blue) and the 12 kDa extrinsic protein (PsbU, grey) (from Ref. 1).

Contribution to research networks

CRC 1078 projekt A5 (Zouni/Dobbek): Structural basis of proton release from the water oxidizing complex in cyanobacterial photosystem II. Key aspects of this project are: improvement of the structure of PSII-crystals, static and dynamic X-ray diffraction measurements in combination with other spectroscopic methods, neutron diffraction measurements of macrocrystals.

UniCat projekt E3/D3: Mn - depleted Photosystem II and X-ray analysis.

The main focus is the determination of the light-induced composition and decomposition of the Mn_4CaO_5 -cluster in the water oxidizing reaction in PSII.

Federal Ministry of Education and Research (BMBF) projekt (Zouni/Lockau/Lisdat): Basistechnologisches Forschertandem.

Nutzung von Sonnenenergie für die Bioelektrokatalyse - Entwicklung von Bioelektrodenstrukturen für die Synthese: This project deals with the isolation, stabilization, modification and assembly of photosystems and photosystem-components in hybrid-assemblies for photocatalysis.

Human Frontier Science Program (HFSP) Projekt (Zouni/Yano): Taking snapshots of photosynthetic water oxidation: simultaneous X-ray spectroscopy and crystallography: Our aim is to identify the chemical structure of the WOC and the dynamic changes at the Mn_4CaO_5 -cluster during the light-induced water splitting reaction.

Cellular biophysics

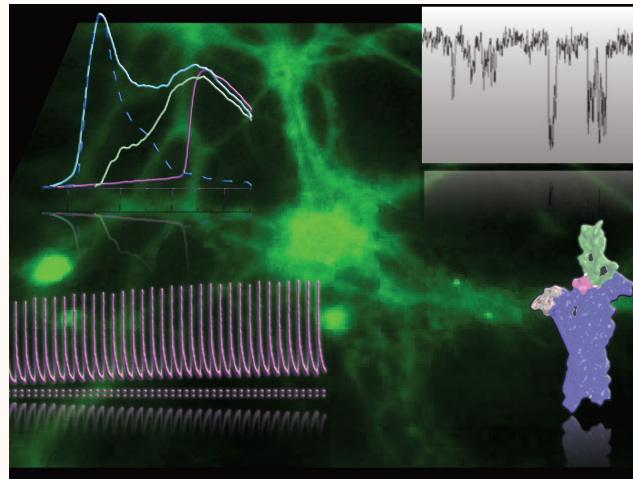

<http://www.leibniz-fmp.de/research/molecular-physiology-and-cell-biology/research-groups/plested/mnbo.html>

Description of the projects:

In the Cellular Biophysics group, we study glutamate receptors and other components of fast synaptic transmission. Synapses are the basic unit for recognising sensory stimuli and for processing information in the brain. They are also likely to be amongst the substrates for storing memories.

We use electrophysiology, structural biology and optical methods to elucidate the activation of glutamate receptors, which are the key responders at the postsynaptic membrane. We also perform computational simulations to bring these results together and generate new hypotheses in order to understand receptor activation at the most fundamental level. Finally, to understand synaptic transmission better in situ, we work to bring enzymes and receptors under the control of light, and also to engineer proteins that can act as reporters of neurotransmission.

In different parts of the brain, synapses have distinct functions that are reflected by their molecular diversity. Receptors appear to be regulated by a large number of factors from both inside and outside the cell, ranging from ions to small molecules, enzymes, associated proteins and physical features like cellular scaffolds. Therefore, one of our major goals is to understand how receptor composition and properties determine synaptic transmission. This work naturally extends to understanding how synaptic responses change over short and long timescales in response to activity and input.

Neurosciences

Experimental biophysics

<https://www.biologie.hu-berlin.de/de/gruppeseiten/expbp>

Description of the projects:

No other biological macromolecules can be characterized as well and comprehensive as photosynthesis protein-complexes and sensory photoreceptors on time scales ranging from fs to minutes (10^{-15} s to 10^2 s). Our research group studies the structure-function relation of sensory photoreceptors from algae, fungi and bacteria. Based on electrophysiological studies on the unicellular alga *Chlamydomonas reinhardtii* we predicted that the eyespot of the alga contains directly light-activated ion channels that after light absorption cause extremely fast depolarization of the plasma membrane. In 2001 we identified these proteins and named them Channelrhodopsins (ChRs). We characterized these novel photoreceptors by a variety of biophysical methods and engineered many variants with altered absorption, kinetics and ion selectivity. These ChRs are now widely applied in the neurosciences for depolarization and activation of selected neurons in large neuronal networks - as for example the mouse brain - with unprecedented precision in time and space, a technology now established as *Optogenetics*. In parallel, we study photoactivatable enzymes with flavin rhodopsin-based light-sensing modules to control cellular second messengers cAMP and cGMP non-invasively with light. Recently we returned to *Chlamydomonas* and established gene targeting technology for deletion and modification of all 12 sensory photoreceptors in hope to understand the network of light sensing in the context of the living alga in its ecological environment.

Collage with the green alga *Volvox globator*, photocycle of a light-activatable channelrhodopsin, 3D-structure in the back, FTIR-difference spectrum (red/blue) and transient absorptions changes.

We work as an interdisciplinary international team with biochemical and biophysical methods as light scattering, electrophysiology, imaging, time resolved Uv/Vis and FTIR spectroscopy, protein crystallization on the steadily improving atomistic understanding of sensory photoreceptors.

Contribution to research networks

CRC/TR 186 Molecular switches for temporal and special regulation of cellular signaling processes. We collaborate with Andrew Plested on the development of Ca-selective light-gated ion channels for application in neuronal systems.

ERC-Advanced Grant Characterization of rhodopsin-guanylyl-cyclases, as members of a so far uncharacterized rhodopsin family.

Cluster of Excellence UniCat and Einstein-Center of Catalysis. We study histidine-kinase-rhodopsins and light-modulated enzymes with flavin-based light sensors.

CRC 1078 Analysis of natural and artificial customized light-activated ion channels and pumps.

Priority program 1665 Resolving and manipulating neuronal networks in the mammalian brain. We work in a collaboration with colleagues of the ZMNH, Hamburg, on optogenetic multi-component systems for the analysis of prefrontal networks in mouse brains.

Einstein-Center Neurocure and Priority program Next Generation Optogenetics.

We develop in collaboration with B. Rost, Charité, light-activated pumps and channel for application in cell compartments.

Biophysics

ENRICO KLOTZSCH
Junior professorship

Experimental biophysics

https://www.biologie.hu-berlin.de/de/gruppen/jpexbbp_portal/

Description of the projects:

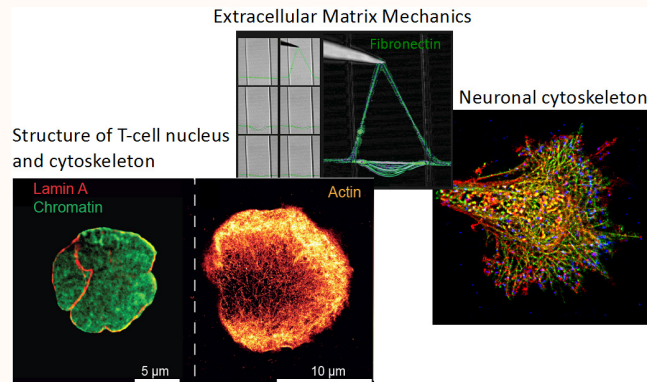

Structure - not only on the molecular level – defines function. Our group aims in bridging the gap between structural and cell biology, particularly to decipher the mechanical aspects of how cells sense and react to their environment. This includes asking how cells employ forces to probe the interaction to other molecules such as receptor-ligand interactions to switch biochemical function, i.e. T-cell activation, migration or their interaction with the extracellular matrix. Furthermore we investigate how these insights can be exploited for biomedical applications.

We use state-of-the-art single molecule microscopy techniques such as super-resolution microscopy, AFM and optical tweezer to gain insights into general aspects of mechanobiology, membrane biophysics, neurobiology and immunology.

Selected publications:

Fibronectin forms the most extensible biological fibers displaying switchable force-exposed cryptic binding sites. E Klotzsch, ML Smith, KE Kubow, S Muntwyler, WC Little, F Beyeler, D Gourdon, BJ Nelson, V Vogel (2009), Proceedings of the National Academy of Sciences 106 (43), 18267-18272.

Superresolution microscopy reveals spatial separation of UCP₄ and F_oF₁-ATP synthase in neuronal mitochondria. E Klotzsch, A Smorodchenko, L Löffler, R Moldzio, E Parkinson, GJ Schütz, EE Pohl (2015), Proceedings of the National Academy of Sciences 112 (1), 130-135.

Left: Super-resolution Microscopy is applied to nuclear and cytoskeletal structure of an activated T-cell.

Top: Mechanical properties of single fibronectin fibers are tested using microelectrical mechanics sensors in combination with confocal microscopy.

Right: 3-color super-resolution microscopy is employed to investigate the structure of growth cones.

Contribution to research networks

Council - Defining the spatial and temporal regulation of neurite branching: The project is in collaboration with Prof. Dr.

T. Fath at UNSW Sydney. The overarching aim of this project is to use super-resolution microscopy to decipher the role of the actin cytoskeleton-associated protein tropomyosin in cell extension of nerve cells (neurons) which is essential for establishing neuronal networks in vitro and in vivo.

HFSP - Mechanical regulated gene expression during T-cell activation: Dr. Klotzsch together with Dr. Ries (EMBL Heidelberg) got awarded the Human Frontiers Science Program Young Investigator Award this project will be carried

out at ETH Zurich, Switzerland, where Dr. Klotzsch holds a second affiliation. The spatial organization of chromatin is of key importance for gene expression and maintenance. Different from stem cell differentiation, during T-cell activation gene regulation happens on a much faster timescale, as the immune response is critical for the bodies defense mechanism. A likely regulatory mechanism for this is the chromatin's 3D structure and its interaction with nuclear lamina.

Here we will study how mechanical forces ultimately regulate gene expression. We hypothesize that mechanical force triggers structural/conformational changes of nuclear lamina network; hence genes encoded in chromatin proximal to lamina can be up/downregulated. We propose to develop new Super-Resolution Microscopy and live-cell imaging technologies and combine them with single cell transcriptomic and epigenetic markers in a correlative approach to resolve the 3D structure of lamina associated chromatin domains and their dynamics during T-cell activation.

Biophysics

ANDREAS HERRMANN

Molecular biophysics

<https://www2.hu-berlin.de/biologie/molbp/>

Description of the projects:

The Molecular Biophysics lab investigates molecular mechanisms of host cell entry, assembly and budding of enveloped viruses, for example of Influenza, Hanta and Ebola viruses. For this purpose, several spectroscopic methods as well as high and super resolution microscopy approaches are applied which allow investigations of single infected living cells and single viruses.

In collaboration with innovative companies in the Berlin area complex biophysical methods for studies of virus-host cell interactions are adapted and developed. In joint projects with chemists, physicists and virologists we unravel the 3D structure and physical properties of viral proteins and develop/patent multivalent antiviral drugs.

Selected publications:

Sieben, C., Kappel, C., Zhu, R., Wozniak, A., Rankl, C., Hinterdorfer, P., Grubmüller, H., Herrmann, A. (2012) Influenza virus binds its host cell using multiple dynamic interactions. *Proc Natl Acad Sci U S A.* 109:13626-13631.

Mair, C.M., Meyer, T., Schneider, K., Huang, Q., Veit, M., Herrmann, A. (2014) A histidine residue of the influenza virus hemagglutinin controls the pH dependence of the conformational change mediating membrane fusion. *J. Virol.*, 88, 13189-13200.

Combined experimental and simulated approach used to characterize attachment of influenza A virus to host cells at molecular level. Binding is accomplished between the viral hemagglutinin (red) and the sialic acid terminated glycans on the cell surface (green). Intact viruses attached to an Atomic Force Microscopy (AFM) cantilever were bound to the cell surface. Retraction of the cantilever until bond failure revealed the size of the underlying force. The approach allows to characterize virus-cell binding in a set-up that mimics the biological situation very closely. This was extended by force probe MD simulation, where a `virtual spring` is attached to the ligand which is then pulled out of the HA binding pocket

EDDA KLIPP

Theoretical biophysics

<https://www2.hu-berlin.de/biologie/theorybp/>

Description of the projects:

How does a cell optimally respond to stress? Which enzymes determine the fluxes through a metabolic network? What is the contribution of different ion channels to ion fluxes? How do single cells communicate during mating? What is the role of osmotic pressure during the cellular growth process?

To answer such question about the regulation of cellular processes, the research group of Theoretical Biophysics develops dynamic mathematical models. The methods comprise the description with ordinary and partial differential equations, the theory of dynamic systems, parameter estimation based on different types of experimental data as well as sensitivity analyses. In addition, we apply discrete network models, agent based or rule based modeling approaches as well as game theory.

The yeast *Saccharomyces cerevisiae* is our most important model organism. Here, we also measure experimentally the dynamics of gene expression or markers for cell cycle progression in single cells and cell populations, for example with fluorescence microscopy and in microfluidics systems. In close collaboration with experimental groups we also develop mathematical models for host-pathogen interactions or for the regulation of metabolism in cancer cells.

Schematic of important processes for the growth of yeast cells: nutrient uptake over the cellular membrane and synthesis of biomass within the cell volume together determine the coordination between progression of cell cycle and the growth of the cell.

Botany

KURT ZOGLAUER

Botany and Arboretum

<https://www2.hu-berlin.de/biologie/arboretum/>

Description of the projects:

The research group “Botany and Arboretum“ has two different research subjects.

Picture: Heidrun Kostial, working group Botany and Arboretum

Selected publications:

Zoglauer K, Behrendt U, Rahmat A, Ross H & Taryono (2003) Somatic embryogenesis – the gate to biotechnology in conifers. Pp. 175-202 in: Laimer M & Rucker W (eds.) Plant Tissue Culture 100 years since Gottlieb Haberlandt. Springer, Wien.

Köhler E (2014) Buxaceae. Pp. 1-124 in: Greuter W (ed.) Flora de la República de Cuba, Series A: Plantas Vasculares, Fascículo 19: Buxaceae, Lauraceae, Theophrastaceae. Koeltz Scientific Books, Königstein.

Picture: Heidrun Kostial, working group Botany and Arboretum

The group “Plant developmental biology“ (the labs are mainly located in Berlin, Invaliden-str.) works on fundamental problems and applications of somatic embryogenesis in plant species which are difficult to propagate by clonal methods, first of all economically important conifers, e.g. Larix and Abies species and hybrids, but also orchid species of horticultural interest. The group “Systematic Botany“ (at Späth-Arboretum of the Humboldt-Universität in Berlin-Baum-schulenweg) works on the diversity, systematics, morphology and evolution of plants with a taxonomic focus on seed-free vascular plants and a geographic focus on tropical Africa and the Caribbean. The group is involved in the compilation of large tropical Floras. Further tasks include public environmental education and plant conservation.

Contribution to research networks

Dendromax: Development and introduction of biotechnological procedures for breeding, production and application of high performing varieties of selected tree species, FNR. Basing on the results of traditional forest tree breeding new biotechnological breeding strategies and procedures will be developed and applied to create high-yielding varieties of Larix hybrids, Abies hybrids, Douglas fir and Aspen.

OptiTanne: Development, Testing and Evaluation of a technological process for clonal mass propagation, plantlet development and clone evaluation in *Abies nordmanniana*, BMBF.

In *Abies nordmanniana* and other attractive *Abies* species specific methods of clonal mass propagation via somatic embryogenesis will be developed and tested to create clonal varieties for Christmas tree production and ornamental uses.

Klonidee: Development of new biotechnologically based breeding and production methods for Lady slipper orchids (*Cypripedium*, *Paphiopedilum*), BMBF.

Lady slipper orchids, mainly of the genera *Cypripedium* and *Paphiopedilum* have a high horticultural and economical importance as exclusive and long-living ornamentals for outdoor and indoor cultivation. Traditional horticultural techniques of clonal mass propagation are inefficient or impossible. In *Cypripedium* somatic embryogenesis has successfully been applied for the development of clonal varieties and shall now be applied to tropical species and hybrids.

Comité Científico Nacional para la Flora de Cuba: There are about 6.500 species of vascular plants on Cuba, more than half of them being endemics. „Flora de Cuba“ is the first inventory ever of this diversity, which is being made accessible to researchers and decision makers through detailed taxon descriptions and determination keys. The project is being coordinated by the Botanical Garden and Botanical Museum Berlin-Dahlem.

Comité de Rédaction de la Flore d'Afrique centrale:

“Flore d'Afrique centrale“ records about 12.000 species of vascular plants occurring in the Democratic Republic of Congo, Rwanda and Burundi, making this diversity accessible to researchers and decision makers for the first time by providing detailed taxon descriptions and determination keys. This flora project is being coordinated by the Botanic Garden Meise (Belgium).

KERSTIN KAUFMANN

Plant cell and molecular biology

<https://www2.hu-berlin.de/biologie/flower/>

Description of the research area:

Plants are able to generate new organs and distinct cell types throughout their life cycle. This fascinating property relies on the function of stem cells that are localized in so-called meristems in shoot and root. Our research is centered on the question, how cell and organ differentiation is encoded in the genome, and how this code is read and executed - depending on growth stage of the plant and on environmental factors.

Our model system is flower development in the model plant *Arabidopsis thaliana* and its closest relatives. We study the functions of homeotic transcription factors. These factors form higher-order protein complexes to specify the distinct organ types in the flower: sepals, petals, stamens and carpels. We characterize gene-regulatory networks and the interplay with epigenetic mechanisms in transcriptional regulation. Furthermore, we are interested how generegulatory networks diversified during plant evolution.

Large image: Expression of a GFP-labelled floral homeotic transcription factor in a young floral meristem in *Arabidopsis*. Small image: Model of a complex of floral homeotic proteins and co-factors, which simultaneously bind to two genomic DNA sites and thereby regulate target gene activity.

KRISTINA KÜHN

Plant molecular cell biology

<https://www.biologie.hu-berlin.de/en/gruppenseiten-en/plantphys/home>

Description of the projects:

Plant cells possess two energy-converting organelles of endosymbiont origin: Mitochondria are the site of cellular respiration whereas chloroplasts transform light energy through photosynthesis. Both organelles possess their own vestigial genome. Correct expression of the latter is indispensable to plant energy metabolism, development and growth.

Left: Arabidopsis plants with impaired mitochondrial function (12 plants, middle and left) display developmental retardation when compared with wild-type plants that have fully functional mitochondria (4 plants on the right).

Right: Mitochondria can be enriched from plant extracts through density gradient centrifugation. In the centrifuge tube shown, they form a whitish band close to the bottom of the tube.

Our research group uses the model organism *Arabidopsis thaliana* in order to investigate the biogenesis and function of plant mitochondria. Much of our work focuses on transcription and further steps of mitochondrial genome expression, on the biogenesis of the oxidative phosphorylation system, and on mechanisms that regulate mitochondrial biogenesis according to a plant's needs. Owing to evolutionary links between the transcriptional machineries in mitochondria and chloroplasts, we are additionally interested in mechanisms of chloroplast genome transcription. Our research employs a variety of methods in molecular biology, genetics, cell biology, biochemistry and physiology.

The mitochondrial genome (mtDNA) of Arabidopsis can be displayed as a circular map. It codes for several subunits of the oxidative phosphorylation system, the ribosomal RNAs, a few ribosomal proteins, and several tRNAs.

Plant physiology

<https://www.biologie.hu-berlin.de/en/gruppenseiten-en/plantphys/home>

Description of the projects:

The Department of Plant Physiology works on several aspects of modern molecular physiology and cell biology in plants. Multiple methods and techniques of biochemistry, genetics, molecular and cell biology are applied in research and training programs for students and young academics. We are interested in the unique properties and functions of plant cells, such as the primary metabolism, pigment biosynthesis and photosynthesis in plastids and focus our efforts on exploring the metabolic control of tetrapyrrole biosynthesis. We study the intracellular communication between the nucleus and the two main plant organelles, plastids and mitochondria, in particular the tetrapyrrole-mediated signalling of plastids. A further research area is the regulation of sucrose transport.

ANNETTE UPMEIER ZU BELZEN

Biology education

<https://www2.hu-berlin.de/biologie/biodidaktik>

Description of the projects:

Biology Education is the science of learning and teaching biological content knowledge and inquiry methods. The main research focus is the modeling and measuring of pupils' students' and teachers' competencies in the area of scientific reasoning (BMBF-KoKoHs). The research questions are dealt with methods of empirical social research. We apply these in experimental intervention studies in which we investigate the effectiveness of teaching units as well as teaching and learning material. The transfer of the outcomes of this international basic research into school practice takes place through several publications, training courses and the Humboldt-ProMINT-Kolleg, in which the STEM-disciplines contribute to development research in the project „Schülerlabore als Lehr-/Lernlabore“ (Deutsche Telekom Stiftung).

Scientific expertise as a demand of schools, universities and educational administration, is addressed in the structured doctoral programme ProMINTion through its central aim to promote junior scientists in the STEM-education.

MARC ERHARDT

Bacterial physiology

<http://www.baktphys.hu-berlin.de>

Description of the projects:

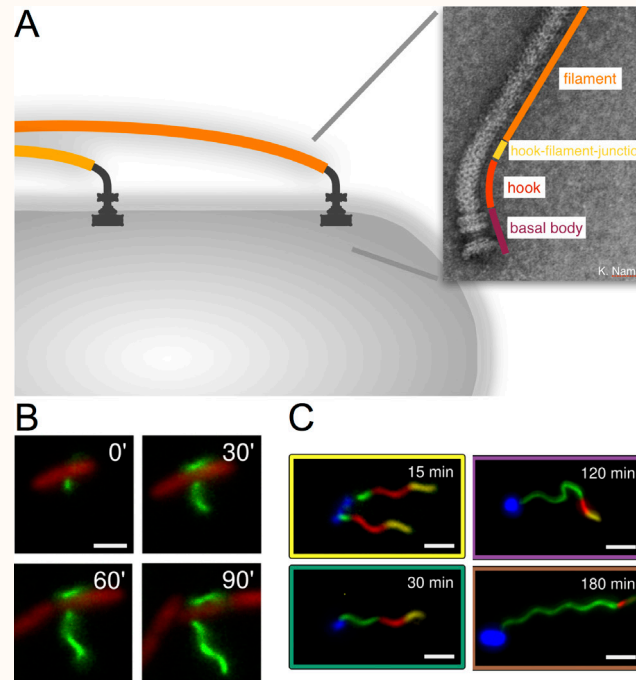

Salmonella are motile pathogens that employ multiple virulence factors to cause gastrointestinal infections. Flagella are the primary motility organelle of bacteria and allow the pathogens to reach the preferred site of infection. The evolutionary-related injectisome is responsible for injection of toxins into eukaryotic host cells.

However, the regulatory mechanisms that control the biosynthesis of these systems, as well as the molecular details of the assembly and protein export function of the flagellum and injectisome remain largely obscure. Accordingly, these self-assembling nanomachines are attractive model systems that allow us to address fundamental research questions in bacterial physiology and microbial pathogenesis.

We thus pursue the following main research questions:

1. What is the role of flagella and bacterial motility in the infection process?
2. How does *Salmonella* regulate its gene expression profile to adapt to diverse and hostile environments inside the host?
3. What are the molecular mechanisms of flagellum assembly and the type-III protein secretion process?

We address these research questions in a hypothesis-driven approach using a combination of sophisticated bacterial genetics and genetic engineering, biochemistry and live-cell microscopy techniques.

Self-assembly of the bacterial flagellum. (A) Schematic illustration (left) and electron micrograph image (right) of bacterial flagella. (B) Real-time imaging of the assembly of flagellar filaments (green) of *Salmonella* (red) using Total Internal Reflection Fluorescence (TIRF) microscopy. (C) Multi-color labelling of the bacterial flagellum allows to analyze the growth dynamics of flagellar filaments.

Microbiology, molecular biology and biochemistry

REGINE HENGGE

Microbiology

<http://biologie.hu-berlin.de/de/gruppenseiten/mikrobiologie/hengge>

Description of the projects:

Bacteria have not only colonized our entire planet but also the human body. We need them to remain healthy, we use them in biotechnology, but some can also make us sick. Almost anywhere bacteria grow in biofilms – surface-associated aggregates of billions of communicating bacterial cells encased in an extracellular matrix. This protective matrix consists of polysaccharides (such as cellulose) and amyloid protein fibres that are structurally related to Alzheimer plaques. When hidden away in their biofilms, bacteria can survive antibiotics and our immune system is powerless against them. As a consequence, biofilms can grow for instance in wounds or on medical implants, which leads to chronic infections that cannot be treated with antibiotics.

In the Hengge group, we investigate the molecular mechanisms that control the formation of the components of the extracellular matrix and the highly complex biofilm architecture in response to the different environmental conditions that bacterial cells experience within a biofilm. These processes are studied in the enteric bacterium *Escherichia coli*, which exists in harmless commensal, but also in highly pathogenic variants. A major focus of our research are the molecular processes by which the signaling molecule c-di-GMP drives biofilm formation in almost all bacteria. As a major goal we also want to identify and understand the mechanisms of action of anti-biofilm compounds of natural origin that may be used together with antibiotics to prevent or combat chronic infections or in some instances my even replace antibiotics.

Contribution to research networks

Excellence Cluster “Image Knowledge Gestaltung – ein Sprachhybrid“. Within this interdisciplinary cooperation between the humanities, natural and technical sciences as well as design and architecture, we analyze the architecture and morphogenesis of bacterial biofilms as an example of „active matter“.

Cluster initiative PathoSurf: In this Berlin-wide cooperation among chemists, biologists, material and medical scientists, we investigate the structure-function relationships of the *E. coli* biofilm matrix with a focus on virulence potential, material properties and the possibility to chemically inhibit matrix formation.

Priority program 1617: “Phenotypic Heterogeneity and Sociobiology of Bacterial Populations“. Here, deterministic and stochastic molecular control processes are studied that generate heterogeneous extracellular matrix composition and distribution within bacterial biofilms.

Priority program 1879: “Nucleotide Second Messenger Signaling in Bacteria“ (Coordinator: R. Hengge). Within this priority programme, we focus on the molecular mechanisms of signal perception and transduction based on synthesis, activity and degradation of the second messenger c-di-GMP in the regulation of biofilm formation.

Microbiology, molecular biology and biochemistry

THOMAS EITINGER

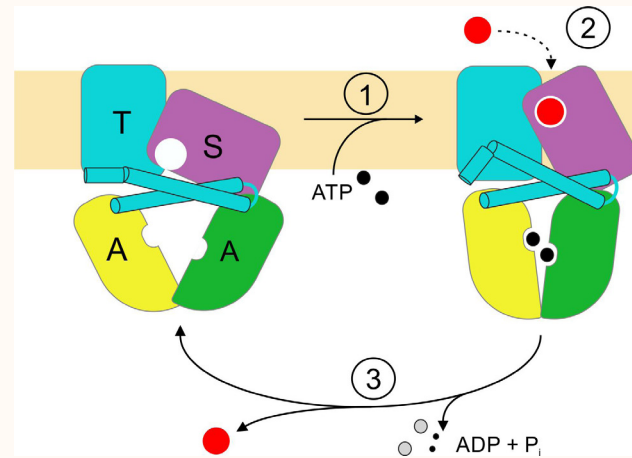

Microbiology

<http://biologie.hu-berlin.de/de/gruppenseiten/mikrobiologie/eitingger>

Description of the projects:

“Energy-coupling factor (ECF)“ transporters were described only recently as a novel type within the large family of ATP-binding cassette (ABC) transporters in a collaborative effort of researchers from Russia, The Netherlands, the U. S. and our group. They are widespread in bacteria and archaea and mediate uptake of vitamins, transition metal ions and other micronutrients. In many gram-positive human pathogens with reduced biosynthetic capacities, ECF-type vitamin transporters are essential for growth within the host. As a focus of our current work we aim at understanding the dynamics of the unprecedented transport cycle of ECF transporters that includes rotation of an integral membrane protein by almost 90° within the membrane. To this end purified transporters are reconstituted in lipid nanodisks and the individual processes during substrate translocation are investigated by biochemical and biophysical techniques. This work is supported by the Deutsche Forschungsgemeinschaft and done in collaboration with groups within and outside Berlin.

Model for the transport cycle of heterooligomeric „energy-coupling factor (ECF)“ transporters. Two molecules of ATP are bound by the ATPase dimer (A) on the cytoplasmic side of the membrane in step 1. Scissors-like reorientations of three coupling helices within the membrane-bound T component result in a rotation of the substrate-binding S component. As a consequence, the substrate-binding pocket is accessible from outside (step 2). Reorientation of the S component upon ATP hydrolysis leads to substrate release into the cytoplasm. (Modified after Finkenwirth, F., ..., Eitingger, T. 2015. *Journal of Biological Chemistry* 290:16929-16942, doi: 10.1074/jbc.M115.654343).

Contribution to research networks

Dynamics of subunit interactions in ECF transporters (in progress): In a collaborative effort funded by the DFG the unusual substrate-translocation mechanism of ECF transporters including rotation of a membrane protein by almost 90 degrees, is investigated by biochemical (reconstitution of purified transporter complexes in nanodisks) and biophysical methods (fluorescence techniques, pulse EPR). Collaborators: A. Herrmann, E. Schneider (within HU), H.-J. Steinhoff (University of Osnabrück).

Mechanism of metal-specific ECF transporters (begin in 2017, funded by the DFG): ECF transporters for Ni²⁺ and/or Co²⁺ ions harbor additional subunits involved in metal-loading onto the S components or metal release. The interactions of those subunits with metal ions and with the core transporters will be analyzed by biochemical and biophysical techniques (Co²⁺-EPR, pulse EPR upon spin labeling, NMR) and structure analyses. Collaborators: A. Lange, B. Martins, E. Schneider (within HU); H.-J. Steinhoff (University of Osnabrück).

Inhibition of ammonia emissions from manure through inhibition of nickel uptake into microbial cells: (estimated start in 2017) The focus of this work is part of the ManUREA technology project funded by the Danish Ministry of Environment and Food and coordinated by H. Karring, University of Southern Denmark. It aims at a reduction of ammonia evaporation caused by urease activity in (pig) manure. Since ureases contain nickel ions at their active site, inhibition of bacterial nickel uptake is a promising strategy towards this goal. Collaborator: H. Karring (University of Southern Denmark).

Microbiology, molecular biology and biochemistry

CHRISTIAN
SCHMITZ-LINNEWEBER

Molecular genetics

<https://www2.hu-berlin.de/biologie/molgen/>

Description of the projects:

Mitochondria and chloroplasts, originating from an endosymbiotic event that took place more than a billion years ago, provided the foundation for the successful evolution of eukaryotic cells. The genome of these organelles has shrunk dramatically over time, and only a few of their genes remain. These, however, are essential for photosynthesis. So far, determination of the regulation of gene expression of these genes has only been successful in a small number of cases.

The Molecular Genetics team has made it their objective to identify the nuclear-encoded factors, which participate in gene regulation of organelles. We are focusing on RNA binding proteins (RBPs), the function of which we determine by means of reverse-genetic, biochemical as well as high-throughput RNA biological analysis tools. Our investigations concentrate on RBPs that are veritable regulators of organellar gene expression.

Moreover, we analyse organellar RNA binding proteins (RBPs) in *Plasmodium*, the pathogen of malaria. Furthermore, we pay special attention to the role of non-coding RNAs as regulators of organellar gene expression in *Plasmodium*, but also in organelles of a variety of other eukaryotic organisms.

ANN EHRENHOFER-MURRAY

Molecular cell biology

<http://www.biologie.hu-berlin.de/de/gruppenseiten/cellbio>

Description of the projects:

Eukaryotic cells organize their DNA in the cell nucleus into a structure called chromatin, which ensures the correct segregation of the genetic material during cell division. At the same time, chromatin regulates the access of DNA during gene expression, replication and DNA repair. Differences in chromatin packaging determine when and where genes are expressed and which gene regions are constantly repressed by heterochromatin (gene silencing). We investigate how the basic elements of chromatin, the histones, are posttranslationally modified by enzymes (for instance acetylation and methylation) and how this alters the binding properties of other chromatin binding factors that regulate chromatin function.

Determination of the acetylation of lysine 16 on histone H4 (H4 K16Ac) by chromatin immunoprecipitation at the GAL1/ GAL10 gene of *Saccharomyces cerevisiae*

As a model system, we mostly use two microorganisms, *Saccharomyces cerevisiae* (baker's yeast) and *Schizosaccharomyces pombe* (fission yeast), as well as the fruit fly *Drosophila melanogaster*. Molecular insights into epigenetic chromatin regulation are important in order to identify therapeutic possibilities for the treatment of diseases that can benefit from epigenetic drugs.

LEONIE RINGROSE

Quantitative biology of the eukaryotic cell

[https://www.biologie.hu-berlin.de/de/gruppen/
eukaryquantbio_portal](https://www.biologie.hu-berlin.de/de/gruppen/eukaryquantbio_portal)

Description of the projects:

We work on epigenetic regulation by the Polycomb (PcG) and Trithorax (TrxG) groups of proteins. Together with transcription factors, these proteins ensure genome-wide transcriptional fidelity. The PcG and TrxG proteins work antagonistically on several hundred developmentally important target genes, to maintain repressed (PcG) or active (TrxG transcription) states. Mutations or aberrant expression of these essential proteins can lead to developmental defects and cancer.

We use a combination of quantitative live imaging, mathematical modeling, and molecular and developmental biology in the fruit fly *Drosophila melanogaster* and in mammalian cell culture. We aim to understand in quantitative terms, how the PcG and TrxG proteins interact with their chromatin targets.

HOLGER DOBBEK

Structural biology and biochemistry

<https://www.biologie.hu-berlin.de/en/gruppenseiten-en/struktbio>

Description of the projects:

Several bacteria and archaea are able to use carbon monoxide, carbon dioxide and several pollutants as energy- or carbon source. Complex metalloenzymes allow the microorganisms converting these unreactive molecules within the mild cellular environment, where in a chemistry lab precious metals and high pressures and temperatures would be needed. How metalloenzymes achieve this remarkable efficiency is hardly understood. We combine methods from protein biochemistry, molecular and structural biology to investigate molecular energy conversions. We want to understand how catalytic processes work and how the catalytic strategies of enzymes evolved over time. Our results will help to develop new (bio-) catalysts for the energy efficient use of carbon monoxide and carbon dioxide, as well as for the degradation of pollutants.

X-ray crystallography allows determining the detailed architecture of metalloenzymes. The diffraction of X-rays at protein crystals (upper left and right) is recorded (middle) to calculate the distribution of electrons.

Contribution to research networks

Cluster of “Unifying Concepts in Catalysis“ (UniCat): Together with partners from TU and FU Berlin, we are investigating the mechanisms of CO/CO_2 -converting enzymes by a combination of spectroscopic, biochemical and theoretical approaches. Thereby we want to analyze common principle and differences between synthetic and biological catalysts and to reveal the chemical basis for the unmatched energy efficiency of CO_2 -reducing enzymes.

Priority program 1927: Iron-Sulfur for Life. In the priority program “Iron-Sulfur for Life“ we

Investigate how homologues ATPases from bacteria and archaea assemble the Ni-, Fe- and S-containing active site metal clusters of CO_2 - and CO-converting enzymes. We could show that the incorporation of Ni in the metal centers depends on ATP and want now to elucidate the mechanism of metal insertion.

Iron-Sulfur for Life
Cooperative Network of Basic Science Centres: Assembly, Biogenesis, Catalysis and Storage

CRC 1078: Proton dynamics in protein function.

Together with the group of Athina Zouni (HU), we investigate the structural basis of water oxidation and proton dynamics in photosystem II.

Photosystem II catalyzes the light-dependent oxidation of water at a Ca-, Mn-, O-containing metal cluster – the central reaction in oxygenic photosynthesis.

Theoretical biology

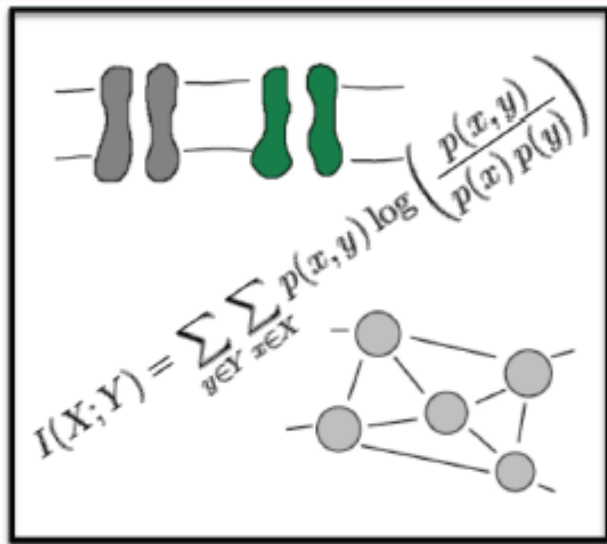

SUSANNE SCHREIBER
Bernstein Award for Computational
Neuroscience

Computational neurophysiology
<http://www.neuron-science.de>

Description of the projects:

Our brain exhibits an astonishingly versatile functional repertoire and can solve the most difficult problems with extraordinary reliability. At the heart of these achievements lies the coordinated activity of a vast number of neurons. This activity is, on the one hand side, determined by the connectivity of cells in local networks and, on the other hand side, by the intrinsic properties of the neurons involved.

Our research approach is based in theoretical methods and mathematical modeling at the level of single cells and neuronal networks.

In typical insect neurons, the cell body is externalized, whereas it is located more centrally between the dendrites and axon in many vertebrate neurons. Our mathematical modeling demonstrates that these constellations, respectively, benefit an energy-efficient signal transfer within the neuron.

The aim of our research group is to uncover the impact of cellular properties (such as the dynamics of ion channels or cellular morphology) on the mechanisms that govern neural information processing as well as their relevance for the behavior of neurons in networks. Our approach to the problem is theoretical, including computer simulations and mathematical modeling. In addition, we cooperate with vertebrate and invertebrate experimental labs to put predictions derived from our mathematical models to test. Often, we like to view the biological system from an evolutionary perspective, allowing us to better understand how evolutionary constraints (like the robustness to temperature variations or limited energetic resources) have shaped neural system design and to derive general principles.

Selected publications:

Bernstein Center for Computational Neuroscience (BMBF): The Bernstein Centers fosters the interdisciplinary exchange of neuroscientific research labs interested in mathematical modeling of neuronal processes.

Bernstein Award (Federal Ministry of Education and Research): In this project our lab investigates the influence of cell-specific electrophysiological and morphological properties on neural processing and coding.

Research groups in the neurosciences (Federal Ministry of Education and Research): Here, we focus on the temperature dependence of neuronal processing. We identify and analyze mechanisms of robust information processing as well as deviations from robustness that are relevant in pathology.

Research Training Group 1589 "Sensory Computation in Neural Systems" (DFG): This graduate school ensures a structured education of PhD students in the field of Computational Neuroscience and offers students a platform for interactions across Berlin universities.

Einstein Center for Neurosciences Berlin: The Einstein Center offers students in the neuroscience graduate programs of Berlin a broad education in the neurosciences and fosters interdisciplinary, collaborative research.

Theoretical biology

PETER HAMMERSTEIN

Evolution of organismic systems

<https://itb.biologie.hu-berlin.de/members/peter>

Description of the projects:

The group participated in the founding of the ITB and belongs since 1996 to this joint endeavor of the Institute of Biology and the Charité. We address problems in theoretical evolutionary biology and study with the help of mathematical models how different evolution-related processes shape the 'design' of organisms.

At the conceptual level we focus on links between thought in biology and economics. These links manifest themselves, for example, in the theory of 'biological markets' – a theory that examines 'trade' between microbes and plants or animals, animals and plants, etc. We are generally trying to identify economic principles in nature and use evolutionary game theory to model conflict and cooperation at both the genetic and organismic level. In particular, we study intracellular bacteria (*Wolbachia* and *Cardinium*) that are known as 'master manipulators' of host reproduction and development and, additionally, as factors of host speciation. Our research topics include themes from evolutionary medicine (e. g., the genetic mother-offspring conflict) and anthropology (e. g., drug-seeking behavior).

Selected publications:

Hammerstein, P. & Noë, R. (2016). Biological trade and markets. *Philosophical Transactions of the Royal Society B*, 371: 20150101.

Hammerstein, P., ed. (2003). *Genetic and Cultural Evolution of Cooperation*. Cambridge, MA: MIT Press.

The whiteboard as the laboratory: Development of mathematical models in theoretical biology.

The dual effect of *Wolbachia*

Male host

'Poisoning sperm'

Female host

Providing an antidote in the egg

Wolbachia and other cytoplasmically inherited bacteria often modify the reproduction of their hosts selfishly and with 'strategic finesse'. We analyze such parasitic manipulations using the tools provided by evolutionary game theory.

Contribution to research networks

The Leverhulme Trust: International Research Network: A Darwinian framework for phenotypically integrating genetic and epigenetic cues. Developing an integrative theory of evolution that encompasses genetic, epigenetic and cultural modes of inheritance.

External Faculty of the Santa Fe Institute New Mexico, U. S. A. Modeling non-linear dynamics in biology, psychology and economics.

International Max Planck Research School on the Life Course: Studying the evolution of social learning and its emerging effects at the population level, such as bubbles on financial markets.

Berlin School of Mind and Brain: Analyzing the effect of drugs on the mesolimbic dopamine system from an evolutionary ecology perspective and taking an anthropological view on drug-seeking behavior.

Association of Members of the Wissenschaftskolleg zu Berlin (Chairperson since 1995). Natural sciences and humanities in dialogue.

Interdisciplinary centre for infection biology and immunity (ZIBI) Graduate School Berlin (Research in Infection Biology and Immunology) Evolutionary medicine: Studying the role of microchimerism and thyroid disease in the – still largely ignored – evolutionary conflict between mother and fetus.

Theoretical biology

MICHAL OR-GUIL

Systems immunology

<https://www.biologie.hu-berlin.de/de/gruppenseiten/sim>

Description of the projects:

The Systems Immunology Lab focuses on translational antibody research in joint projects with academic, clinical and industry partners. Its primary objectives are to better the understanding of anti-body action during immune responses as well as to exploit antibody binding signatures for diagnostic purposes.

Past accomplishments of the Lab include i) the development of data analysis tools for assessment of antibody binding properties and evaluation of immunoassays, and ii) the development of an all-in-one tool for biomarker extraction, validation and diagnostic application.

In addition, the Systems Immunology Lab takes a leading role in forwarding and applying Systems Medicine approaches. As part of the e:KID consortium, it currently seeks to improve personalized immunosuppressive medication following kidney transplantation.

Selected publications:

Or-Guil, M., and Faro, J. (2014). A major hindrance in antibody affinity maturation investigation: we never succeeded in falsifying the hypothesis of single-step selection. *Front. Immunol.* 5, 237.

Wittenbrink, N., Klein, A., Weiser, A.A., Schuchhardt, J., and Or-Guil, M. (2011). Is there a typical germinal center? A large-scale immunohistological study on the cellular composition of germinal centers during the hapten-carrier-driven primary immune response in mice. *J. Immunol.* 187, 6185–6196.

The Systems Immunology Lab at a glance (clockwise): Detail of a peptide array serum antibody signature; data-driven discrimination of bead populations in flow cytometry data of their 14-plex mix; confocal microscopy image of a murine splenic germinal center; and mathematical simulation of the growth kinetics of B-cell populations in germinal centers.

Contribution to research networks

e:KID (e:Med, BMBF)

e:KID is a collaborative project involving clinical departments, research institutes, biometrics departments, translational, and industrial partners. The aim of e:Kid is to establish and validate a systems medicine model for quantification of complication risks after kidney transplantation that shall ultimately aid early-stage personalized therapy. To achieve such a model, a broad range of genetic, post-translational (protein, epigenetic) as well as cellular parameters are examined and used in a large clinically well-characterized cohort of patients (Harmony study, DRKS-ID: DRKS00000452).

FlowPep (ZIM, BMWi)

FlowPep is a research alliance of the Systems Immunology Lab and the two Berlin-based

SMEs, Bio-syntan GmbH and PolyAn GmbH.

The alliance aims at developing a procedure to measure antibody-peptide interactions in a multiplex bead assay. The procedure, which is referred to as PepOnBeads, bundles biomarker extraction, validation and clinical application in an all-in-one tool.

StratMarker (GIF - German-Israeli Foundation for Scientific Research and Development)

In collaboration with the Ofran Lab of Systems Biology and Functional Genomics (lead by Yanay Ofran, Bar Ilan University, Israel), the Systems Immunology Lab seeks to develop and implement new strategies for optimization of peptide biomarkers in serological diagnostics. The development strategy includes both experimental and bioinformatics methods.

Theoretical biology

RICHARD KEMPTER

Theory of neural systems

<https://itb.biologie.hu-berlin.de/~kempter/>

Description of the projects:

The research group „Theoretical Neuroscience“ is interested in the neural basis of learning and memory. Research involves the biophysical modeling and mathematical analysis of synapses, neurons, and neural systems. Theoretical approaches and computer simulations are used to study synaptic short- and long-term plasticity, the dynamics of single neurons, and the interaction of neurons in recurrently coupled networks. We are particularly fascinated by mechanisms that control the development and functional stability of neural circuits. One of the key goals is to unravel how such systems remain susceptible to learning, and, at the same time, maintain a robust balance against instabilities. Understanding the mechanisms that prevent neural tissue from developing pathological activity patterns will also help to uncover origins of functional brain illnesses and lead to practical implications for designing remedial therapies. Model systems are the hippocampus and the early auditory system.

Selected publications:

E. T. Reifenstein, C. L. Ebbesen, Q. Tang, M. Brecht, S. Schreiber, and R. Kempter. Cell-type specific phase precession in layer II of the medial entorhinal cortex. *J. Neurosci.* 36:2283-2288, 2016.

C. Leibold, A. Gundlfinger, R. Schmidt, K. Thurley, D. Schmitz, R. Kempter. Temporal compression mediated by short-term synaptic plasticity. *Proc. Natl. Acad. Sci. USA* 105, 4417-4422, 2008.

Schaltkreis-Mechanismen der Phasenpräzession: Experiment und Theorie: Die neuronale Aktivität von Orts- und Gitterzellen in der hippocampalen Formation zeigt eine systematische Beziehung zum Theta-Rhythmus des EEGs: Wenn das jeweilige Ortsfeld durchquert wird, verschiebt sich der Zeitpunkt der Aktionspotenziale gegenüber dem Theta-Rhythmus, d. h. die Aktionspotenziale „präzessieren“. Diese sogenannte Phasenpräzession ist eines der am meisten untersuchten Phänomene in den systemischen Neurowissenschaften. Nach wie vor besteht kein Konsens wie Phasenpräzession entsteht. Frühere Arbeiten zur Phasenpräzession zeigten, dass sich zwar leicht Modelle generieren lassen, aber der Ausschluss von Modellen an vier miteinander verwobenen Problemen scheitert. (ist TP vom SPP 1665; evtl. weglassen)

Contribution to research networks

Priority program 1665: Resolving and manipulating neuronal networks in the mammalian brain - from correlative to causal analysis. The mammalian brain accounts for complex sensory, motor, and cognitive abilities by processing environmental and internal information within neuronal networks. A fundamental aim of systems neuroscience is to decipher the mechanisms by which sensory perception and cognitive abilities are encoded onto activity patterns of neuronal networks.

Research Training Group 1589: Sensory Computation in Neural Systems. The Research Training Group “Sensory Computation in Neural Systems“ combines techniques and concepts from computational neuroscience, systems neurobiology, and machine learning, in order to specifically address sensory computation. Experimentalists and theoreticians join forces and educate young scientists. 3-year research project: Delineating and testing a microcircuit model of parahippocampal phase precession. The project is funded by the German Research Foundation (Deutsche Forschungsgemeinschaft, DFG) within the Priority Program 1665 (Schwerpunktprogramm) “Resolving and manipulating neuronal networks in the mammalian brain – from correlative to causal analysis“. The project will start in November 2016. Collaborators are Prof. Michael Brecht (Humboldt-Universität zu Berlin), Prof. Dietmar Schmitz (Charité), and Prof. Richard Kempter (Humboldt-Universität zu Berlin). Further details can be found at http://www.spp1665.de/projects_2_delineating.html.

Zoology

MICHAEL BRECHT

**Animal physiology/
systems neurobiology and neural computation**

<https://www.activetouch.de>

Description of the projects:

Our research group is active in the field of neuronal basis of behavior with a focus on two major questions:

1. Which circuits underlie spatial memory?
2. Which circuits evoke social behaviors in the forebrain?

To answer both questions, our research group develops new research methods, i.e. techniques for intracellular measurements, or so-called juxtacellular measurements, in freely behaving animals. Using such methods, we study the structure-function relationships in the mammalian brain. In the paper of Ray et al., 2014 we described a highly ordered circuit in the spatial memory. We focus on such approaches also when we investigate the socio-sexual information processing; i.e. in the paper of Lenschow et al., 2016 we described the genital representation in the rat somatosensory cortex. Although the external genitals show a marked sexual dimorphism, the neuronal representation is sexually monomorphic (see Figure).

Lenschow et al. Figure: Anatomical maps of male (left) and female (right) bodies in the neocortex of the rat; body maps are revealed by a stain for metabolic activity (Cytochrome oxidase histochemistry). Maps were interpreted by alignment to physiological recordings (bottom drawings). Qualitative and quantitative analysis of such maps revealed a sexual monomorphism of cortical genitals.

Selected publications:

Contribution to research networks

Bernstein Center for Computational Neuroscience (BCCN Berlin): The BCCN Berlin is a joint research center of Charité, Humboldt-Universität zu Berlin, and Technische Universität Berlin. The newly founded “Interdisciplinary Center Computational Neuroscience“ (ICCN) of Humboldt-Universität zu Berlin is supporting the BCCN Berlin.

Research Unit CRC 665: Developmental Disturbances in the Nervous System. In this special research unit, we analyse together with colleagues from institutions all over Berlin the development of the nervous system.

Cluster of Excellence NeuroCure: In this Berlin-wide cluster of excellence, we coordinate and jointly develop the neuroscientific research.

The Einstein Center for Neurosciences Berlin: This center is funded by the State of Berlin and it focuses on various research topics, i.e. a core area is the interdisciplinary training of young neuroscientists.

Priority program 1665: Resolving and manipulating neuronal networks in the mammalian brain - from correlative to causal analysis. In this project we investigate the mechanism of memory formation together with the lab of Kempter & Schmitz (Charité).

German Center for Neurodegenerative Diseases (DZNE): In this research association we investigate alterations of memory circuitry during neurodegenerative processes.

Zoology

RÜDIGER KRAHE

Behavioural physiology

https://www.biologie.hu-berlin.de/de/gruppen/verhaltensphys2_portal/standard

Description of the projects:

All animals have sense organs that relay information on the organism's environment and its own body to the brain, where the information is then analysed. The Behavioural Physiology Lab studies the mechanisms used by the nerve cells in the brain with which sensory information is processed. To understand these mechanisms, it is essential to understand the tasks they have to perform in the animal's natural life, under natural environmental and behavioural conditions. This is important as sensory systems have been shaped in the course of evolution to function under these conditions. Therefore, our group uses on the one hand neurobiological methods to study sensory information processing; on the other hand, we use a multitude of approaches to decipher the selection pressures acting on sensory processing mechanisms. This includes, for example, behavioural observations and experiments in the lab as well as in the animal's natural habitat, phylogenetic analyses and experiments on the energetics of sensing. Specific topics addressed by our group are sensory processing by topographic maps in the brain, neuromodulation and energetics of sensory processing, and the effects of biotic and abiotic environmental factors on the acquisition of sensory information.

The sensory system we study is the electrosensory system of weakly electric fish. These nocturnal tropical fish produce weak electric fields and sense perturbations of the self-generated electric field caused by objects in their environment (see snapshot of the isopotential lines on the bottom right). In addition, they use their electric discharges for communication with conspecifics in aggressive and courtship encounters. The bottom-left panel depicts three parallel topographic maps of the electrosensory body surface that are found in the hindbrain. The two fish on the top right are African mormyrid fish, the other two are Central and South American gymnotiform fish. A big experimental advantage of studying this particular sensory system is the ease with which electric signals in water can be measured and reproduced.

MATTHIAS HENNIG

Behavioral physiology/ neuroethology

<https://www2.hu-berlin.de/biologie/vhphys/people/hennig/>

Description of the projects:

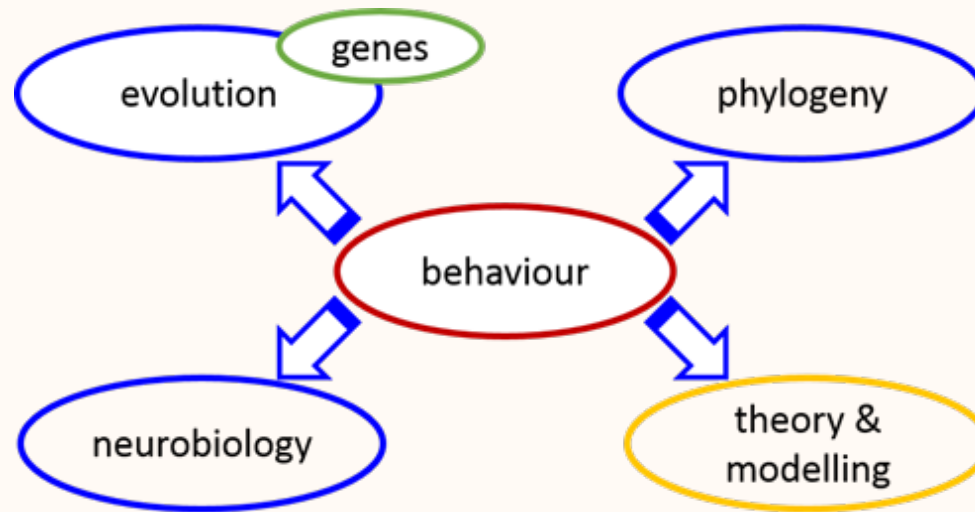

Neuroethology asks how animals sense the world and how they use this information for motor control and behaviour. Our research focusses on the algorithms of sensory processing and motor control of acoustic communication in crickets. By a comparative approach we also investigate the evolution of behaviour and its neuronal and genetic basis.

An advantage of insects as research objects stems from the relative ease by which their behaviour can be quantified and the activity of single neurons and small neural networks can be recorded. Our techniques encompass a range of behavioural and electrophysiological approaches. A suite of computer-controlled set-ups with high through-put technology allows us to quantify the behaviour and acoustic choice behaviour for many individual crickets in a short time.

Selected publications:

Hildebrandt KJ, Benda J, Hennig RM (2015) Computational themes of peripheral processing in the auditory pathway of insects. *J Comp Physiol A* 201:39-50.

Gabel E, Gray DA, Hennig RM (2016) How females of chirping and trilling field crickets integrate the 'what' and 'where' of male acoustic signals during decision making. *J Comp Physiol A*, DOI: 10.1007/s00359-016-1124-x.

Acoustic communication behaviour in crickets lies at the center of research for comparative research in several disciplines of biology, from theoretical to neurobiological questions to evolution, phylogeny and genes.

Contribution to research networks

DFG grant: decision making in crickets: choice behaviour and neuronal control. Female crickets evaluate several attributes in a male's acoustic signal during long distance communication and their decision for mate choice behavior. Here we investigate how different sensory cues are integrated to arrive at a decision for a particular song signal of a male cricket.

Leibniz Association: in collaboration with the Museum für Naturkunde: GenArt: functional genomics of biological speciation. How do genes contribute to evolution and speciation? In the GenArt-project this question is examined for several animal groups, from electric fish to grasshoppers and crickets using behavioural phenotyping and NGS-technologies.

Zoology

YORK WINTER

Cognitive neurobiology

<http://www.winterlab.org/dnn/en-us/home.aspx>

Description of the projects:

Our research focuses on the cognitive abilities of animals in the context of decision making while foraging. In addition, using a large variety of methodological approaches, we quantify the general behavioral phenotype of lab animals (in particular, of mice and rats) used as models of neurological and psychiatric diseases. We develop and apply technical systems for automated tracking and analysis of behavior. These systems allow us on the one hand the efficient phenotypic description of lab animals, such as mice and rats, coming from different genetic backgrounds. On the other hand, we use the same approaches for behavioral research in the wild to investigate the rules of decision making of free-living nectar-feeding bats and the evolutionary consequences thereof on bat-pollinated plants.

Selected publications:

Investigations of the cognitive mechanisms of decision making: Nectar-feeding bat (*Glossophaga commissarisi*) hovering in front of a flower of the bat-pollinated *Mucuna holtonii* in Costa Rica (left). „Lab“-mouse (*Mus musculus*, right).

Contribution to research networks

Cluster of Excellence NeuroCure

NeuroCure is a cluster of excellence funded through the Excellence Initiative and located at the Charité – University Medicine Berlin, the Humboldt-University and the Free University Berlin. Its research focus is in neuroscience. The interdisciplinary research network focuses on the translation of insights from basic science research to clinical application.

Berlin School of Mind and Brain

An interdisciplinary center for cooperation and training focusing on central questions about the human mind. This includes perception and consciousness, language, learning and memory as well as neuro-psychiatric diseases. Tackling these questions requires collaboration between various disciplines, such as philosophy, linguistics, computer science, psychology, and neuroscience.

Zoology

GERHARD SCHOLTZ

Comparative zoology

<https://www2.hu-berlin.de/biologie/zoologie/>

Description of the projects:

Comparative zoology deals with the interface of development and evolution of arthropods and metazoas. Comparative morphological, embryological and molecular investigations are performed as the basis for phylogenetic analyses including the reconstruction of evolutionary transformation. A central focus is the analysis of cell genealogy and its evolution at critical points in development. Further focal points are the comparative evolutionary analysis of complex morphological patterns of the nervous system, muscles, sex organs as well as deformities of arthropods. Further, comparative zoology together with the arts and sciences aid in understanding the theoretical concept of homology, evolutionary development biology as well as analytical morphology.

Selected publications:

Brenneis, G. & Scholtz, G. (2014) The 'Ventral Organs' of Pycnogonida (Arthropoda) are neurogenic niches of late embryonic and post-embryonic nervous system development. *PLoS One* 9(4): e95435.

Liu, Y., Scholtz, G. & Hou, X. (2015) When a 520 million-year-old Chengjiang fossil meets a modern micro-CT – a case study. *Scientific Reports* 5: 12802.

Contribution to research networks

Excellence Cluster "Image Knowledge Gestaltung – ein Sprachhybrid": Within this interdisciplinary cooperation between the humanities, natural and technical sciences as well as design and architecture, we analyze the architecture and morphogenesis of bacterial biofilms as an example of „active matter“.

CRC/TR 175: The Chloroplast as Central Coordinator of Acclimation in Plants. In collaboration with 18 participating project partners, the astonishing role of chloroplasts as sensors and signal emitters in acclimation processes is being analysed. The consortium of these partners is predominantly using quantitative biological tools in their aim to show the complexity of chloroplast functions in acclimation to temperature and light changes.

Structural flexibility of the optical design of the cornea of arthropods: the cuticula of the arthropods is a multifunctional biological composite material composed of chitin filaments imbedded in a protein matrix. We compare the cuticle structure of the eye and the rest of the body of different arthropods with different complex eye types. The aim of the project is to clarify the fine structure of the cuticle cornea and how it influences the optical characteristics of a complex eye.

Zoology

LILIANE RUEß

Ecology

<https://www.biologie.hu-berlin.de/de/gruppenseiten/oekologie>

Description of the projects:

The science 'ecology' has gone a long way since the time when scientist still used botanist's vasculum, lenses and butterfly net to investigate the interchange of flora and fauna. Today, the working group 'ecology' uses in addition to these classical morphological and taxonomical approaches, a wide spectrum of modern biochemical and molecular techniques to investigate terrestrial ecosystems and their cycles. The diverse group of threadworms is in our special interest, especially the model organism *C. elegans* as well as the nematode population in the soil and their function in the food web. Due to the difficulty of access and the small size of the organism, the soil has remained a 'black box' for a long time.

We use fatty acids and stable isotopes as bio markers to make processes in these cryptic habitats visible. With the help of such biochemical fingerprints, we investigate the energy and nutrient flow in soil food networks. Carbohydrates are an important player since soils act as source or sink for especially CO₂ and can sustainably influence atmospheric CO₂ levels.

Wilsonema otophorum, a frequent bacterial eater of the ground.

Selected publications:

Pausch, J., Kramer, S., Scharroba, A., Scheunemann, N., Butenschoen, O., Kandeler, E., Marhan, S., Riederer, M., Scheu, S., Kuzyakov, Y., Ruess, L. (2016). Small but active - pool size does not matter for carbon incorporation in belowground food webs. *Functional Ecology* 30, 479-489.

Ruess, L., Chamberlain, P.M. (2010). The fat that matters: Soil food web analysis using fatty acids and their carbon stable isotope signature. *Soil Biology & Biochemistry*, 42, 1898-1910.

Contribution to research networks

Research Group 918: Carbon flow in belowground food webs assessed by isotope tracers (Speaker). The group consists of nine component projects and investigates interactions in the soil food network. Stable isotopes of carbon are used as tracers to identify biotic key groups, to quantify carbon flow and to establish food net models. The overall aim is a complete carbon budget from the input of plants to the flow through different parts of the food web until the loss of CO₂ to the atmosphere. We use natural ¹³C signal (C₃ versus C₄ plants) as well as pulse label with ¹³CO₂ to follow the trophic carbon flux with stable isotope probing (SIP) in biomolecules such as RNA (RNA-SIP) or fatty acids (FA-SIP).

The Biodiversity Exploratories are a German Science Foundation funded research project (DFG Priority Programme 1374). The three exploratories serve as open research platform for all biodiversity and ecosystem research groups of Germany. Study Objectives:

1. the understanding of the relationship between biodiversity of different taxa and levels
2. the role of land use and management for biodiversity and
3. the role of biodiversity for ecosystem processes.

We use moreover the analysis of the fatty acid patterns of the ground as a measure of the structure and function of the microbiological communities as well as as a marker for trophic relations. Besides, the micron food net of the Nematodes finds application as a model for the interactions and rivers in the whole ground food net.

Zoology

KAI MATUSCHEWSKI

Molecular parasitology

<https://www.biologie.hu-berlin.de/de/gruppenseiten/molpara/>

Description of the projects:

Parasites are eukaryotic pathogens that infect virtually every free-living organism. They are causative agents of important, and often poverty-associated, infectious diseases and one of the most pressing global threats to human health and fragile economies in the tropics. During parasite/host co-evolution parasites adopted complex mechanisms of efficient transmission, immune evasion, and chronic infection. A hallmark is a hard-wired developmental program that encompasses tailor-made extracellular and intracellular parasite stages and stage conversion during host switch.

A better molecular understanding of the mechanisms that drive parasite/host interactions and the complex life cycle is a prerequisite for novel evidence-based control strategies.

Plasmodium sporozoite, the infectious stage of malaria parasites.

In the Department of Molecular Parasitology parasites that cause malaria, toxoplasmosis and wildlife infections are studied using molecular, experimental genetics and biochemical approaches. Insights from the clinically silent liver phase of *Plasmodium* infections permit previously unrecognized opportunities to attenuate the parasite prior to malaria symptoms and provide the host with a decisive immunological advantage. Systematic reverse genetic studies of the metabolic flexibility of *Toxoplasma* open new perspectives for curative drugs. Phylogenetic studies of closely related parasites in native and afro-tropical wild animals contribute to an informed evaluation of complex ecosystems and biodiversity.

Asexual replication inside erythrocytes causes all symptoms and pathology associated with malaria.

Selected publications:

Kenthirapalan, S., Waters, A.P., Matuschewski, K., Kooij, T.W.A. (2016) Functional profiles of orphan membrane transporters in the life cycle of the malaria parasite. *Nat. Commun.* 7, 10519.

Sato, Y., Hliscs, M., Dunst, J., Goosmann, C., Brinkmann, V., Montagna, G.N., Matuschewski, K. (2016) Comparative *Plasmodium* gene overexpression reveals distinct perturbation of sporozoite transmission by profilin. *Mol. Biol. Cell* 27, 2234-2244.

Contribution to research networks

Research Training Group 2046: Parasite Infections from experimental models to natural systems. Employing genetically attenuated and transgenic parasites antigen-specific immune responses are investigated to reliably predict sustained anti-malaria vaccine efficacy.

IRI Life Sciences: The IRI for the Life Sciences at the Humboldt University is a collaborative research institute founded in collaboration with the Charité Hospital and the MDC with the goal of bridging theoretical and quantitative experimental approaches at multiple scales of biology, from molecules to cells to organisms and populations.

Interdisciplinary Centre for Infection biology and Immunity (ZIBI) Graduate School Berlin: The interdisciplinary centre for infection biology and immunity (ZIBI) was founded in 2005 at the Humboldt's university to Berlin. It bundles up the activities of the free university, Humboldt's university and external-university institutions in the area of the infection biology and immunity.

Zoology

JOHN A. NYAKATURA

Morphology and the history of forms

<http://nyakaturalab.com/>

Description of the projects:

The interdisciplinary group is based at the cluster of excellence Image Knowledge Gestaltung: an Interdisciplinary Laboratory. It is building a bridge between the Institute of Biology and the Institute of Art History and Visual Studies. On the one hand we analyse how especially images and imaging techniques were used historically and are used today to generate and disseminate new morphological knowledge. On the other hand our group is concerned with the functional morphology and evolution of land-living vertebrates. Collection-based approaches such as three-dimensional geometric morphometrics and experimental approaches such as in-vivo motion analyses are integrated to study form-function relationships on an organismic level in the context of evolution. The key concept of biological adaptation is in the centre of our interest. Additionally, the group has an interest in palaeontology. In innovative collaborations with engineers and specialists from the field of computer generated images new research tools are developed for morpho-functional analyses and the reconstruction of vertebrate fossils.

Morphological diversity of femora of squirrels and their kin. Laser surface scans.john

Contribution to research networks

Excellence Cluster “Image Knowledge Gestaltung – ein Sprachhybrid“: Within this interdisciplinary cooperation between the humanities, natural and technical sciences as well as design and architecture, we analyze the architecture and morphogenesis of bacterial biofilms as an example of “active matter“.

Zoology

MATTHEW LARKUM

Neuronal plasticity

<https://www.projekte.hu-berlin.de/en/larkum/>

Description of the projects:

A basic feature of intelligent systems like the cerebral cortex is the ability to freely associate aspects of perceived experience with an internal representation of the world and make predictions about the future. We are interested in the computational power of single neurons and their contribution to cortical function. Our main hypothesis is that the extraordinary performance of the cortex derives from an associative mechanism built in at the cellular level to the basic neuronal unit of the cortex - the pyramidal cell (Larkum, 2013). The mechanism is robustly triggered by coincident input to opposite poles of the neuron, is exquisitely matched to the large and fine scale architecture of the cortex and is tightly controlled by local microcircuits of inhibitory neurons targeting subcellular compartments. We are currently testing this hypothesis (“BAC firing”) on many levels using a variety of research techniques including multiple dendritic patch-clamp recordings in vitro, extracellular electrophysiological techniques, calcium imaging, somatic and dendritic patch-clamp recordings in vivo, two photon imaging (in vitro and in vivo), rodent behavioural experiments and optogenetic approaches.

Schematic representation of a hypothesis on the function of cortex based on the active dendritic properties of pyramidal neurons in layer 5. The properties afford the pyramidal neurons with the ability to associate expectation with data to achieve a coherent percept. PAWEL ROMANCZUK

Collective information processing

<http://lab.romanczuk.de/>

Description of the projects:

The Emmy Noether group “Collective Information Processing“ at the Department of Biology (Institute of Theoretical Biology), associated with the Bernstein Center for Computational Neuroscience, is headed by Dr Romanczuk. The primary focus of our research is the development and analysis of mathematical models of collective behavior which take into account individual sensory perception. The combination of theory and modelling in close collaboration with experimental partners, aims at exploring the fundamental properties and constraints of sensory perception on collective motion and decision making within animal groups. The main focus of the modelling are vision mediated interactions with locust swarms and fish schools as experimental model systems.

Selected publications:

Landgraf, T., Bierbach, D., Nguyen, H., Muggelberg, N., Romanczuk, P., & Krause, J. (2016). RoboFish: increased acceptance of interactive robotic fish with realistic eyes and natural motion patterns by live Trinidadian guppies. *Bioinspiration & Biomimetics*, 11(1), 015001. <http://doi.org/10.1088/1748-3190/11/1/015001>

Contribution to research networks

Emmy Noether programme: Within the scope of the Emmy of Noether programme promotes the German Research Foundation (DFG) prominent up-and-coming researchers with the aim to attain early scientific independence. Within this programme Dr Romanczuk works on the project “Collective Information Processing - From Individual Sensory Inputs to Swarming and Collective Decision Making“.

Cooperation and Collective Cognition Network (CoCCoN), Princeton University and Humboldt Universität zu

Berlin: The network brings together scientists from a broad range of disciplines, such as biology, psychology, sociology, economics and applied math. It provides an interdisciplinary environment for collaborative study of cooperation and collective cognition in human and animal systems, with the main research focus being behavioral contagion and the role of social norms on collective behavior. Hereby, analogies and differences between bio-ecological and socio-economical systems shall be discussed. A unique feature of the network is the direct exchange between empirical and theoretical research, which enables a close connection between mathematical modeling and experimental observation of relevant processes.

NATALIA TSCHOWRI

Cyclic di-nucleotide signalling in bacterial differentiation and antibiotic production

http://biologie.hu-berlin.de/de/gruppenseiten/mikrobiologie/tschowri_group

Description of the projects:

In 2016, Vereinigung für Allgemeine und Angewandte Mikrobiologie (VAAM) selected *Streptomyces* as the Microbe of the Year (Fig. 1). These multi-talented bacteria have already been awarded the Nobel Prize twice: 1952 for the synthesis of the antibiotic Streptomycin and 2015 for the production of the anti-parasitic agent Ivermectin. They also produce anti-fungals, anti-cancer substances and immunosuppressants and represent the most abundant and important source of bioactive compounds for medical, veterinary and agricultural use.

The synthesis of these secondary metabolites is genetically and temporally tightly interlinked with the developmental life cycle of streptomycetes. This life cycle includes the transition from hyphal growth to sporulation (Fig. 2) and is controlled by the signalling molecules cyclic di-nucleotides. The research of Natalia Tschowri focuses on the question how and via which molecular mechanism(s) cyclic di-GMP and cyclic di-AMP regulate morphological and physiological differentiation processes in *Streptomyces* bacteria.

Selected publications:

Tschowri N, Schumacher MA, Schlimpert S, Chinnam NB, Findlay KC, Brennan RG, Buttner MJ. Tetrameric c-di-GMP Mediates Effective Transcription Factor Dimerization to Control *Streptomyces* Development. *Cell*, 2014 Aug 28;158(5):1136-47.

DAVID GARFIELD

Evolutionary biology

<http://www.garfieldlab.org/>

Description of the projects:

A fundamental tenet of Darwinian evolution is that differences between species develop from variation within species. Our work hews closely to this principle by using population genetics and comparisons between closely related species to understand the mechanisms by which natural selection shapes embryonic development and, ultimately, organismal form. Our lab focuses specifically on the mechanisms underlying the evolution of developmental gene expression using a variety of genomics tools. In our deployment of these tools, we work closely with other Berlin-based groups to bring cutting-edge tools normally associated with biomedical research to bear on problems in Evolutionary Biology. As part of our research mission, we also help to develop tools from Evolutionary Biology, in particular population genetics, to help biomedical researchers better understand and identify mutations associated with human disease.

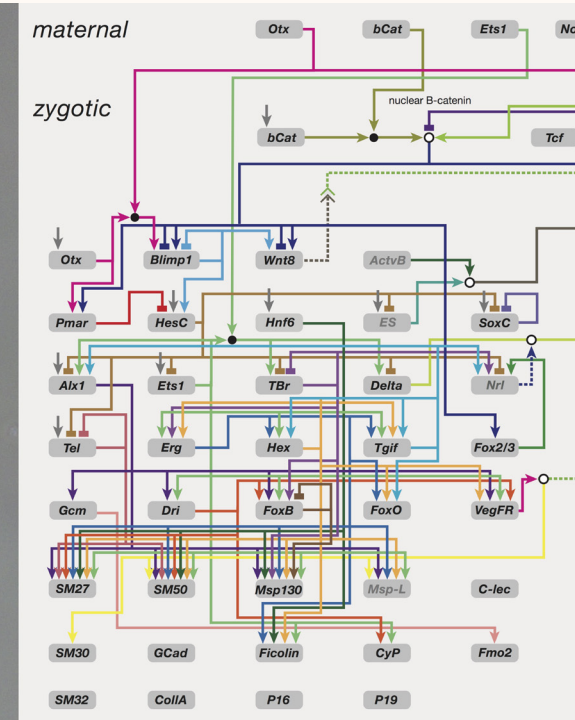

Selected publications:

Zichner T., DA Garfield, et al.. Impact of genomic structural variation in *Drosophila melanogaster* based on population-scale sequencing. *Genome Research*. 2013. 23: 568-579.

Garfield, DA et al.. The impact of gene expression variation on the robustness and evolvability of a developmental gene regulatory network. *PLoS Biology*. 2013. 11: e1001696.

Sea urchin larvae of different species are easily identified by the shape of their skeletons. We examine changes in the expression and sequence of interacting genes to understand how selection has shaped this diversity of forms.

Contribution to research networks

RALF STEUER

Metabolic network analysis

<https://itb.biologie.hu-berlin.de/wiki/groups/steuer/start>

Description of the projects:

The evolution of oxygenic photosynthesis was one of the most important metabolic innovations on this planet and has influenced the Earth's geochemistry like no other biological process. The focus of our research is to understand cyanobacterial phototrophic growth using a combination of experimental analysis and mathematical modeling. We seek to describe cyanobacterial growth as an interplay of different cellular processes, such as light harvesting, electron transport, cellular metabolism, the circadian clock, among others, that together give rise to cellular growth. We thereby seek to bridge the gap between knowledge-driven research and applications in green biotechnology. Predictive mathematical models of phototrophic growth have manifold direct applications, such as for the identification of suitable intervention strategies to increase the yield of desired products and to optimize commercially viable cultivation conditions.

Selected publications:

Westermarck S and Steuer R (2016) Toward Multiscale Models of Cyanobacterial Growth: A Modular Approach. *Front. Bioeng. Biotechnol.* 4:95. doi: 10.3389/fbioe.2016.00095.

Knoop H, Gründel M, Zilliges Y, Lehmann R, Hoffmann S, Lockau W, Steuer R. (2013) Flux balance analysis of cyanobacterial metabolism: the metabolic network of *Synechocystis* sp. PCC 6803. *PLoS Comput Biol.* 9(6):e1003081. doi: 10.1371/journal.pcbi.1003081.

Excerpt of a cyanobacterial metabolic "route map". One of our research projects is to reconstruct the biochemical repertoire of diverse cyanobacteria. Genome-scale metabolic reconstructions are the outcome of an iterative process that involves literature research, sequence comparisons, integration of high-throughput data and targeted biochemical tests. The reconstruction of the cyanobacterium *Synechocystis* sp. PCC 6803 encompasses approximately 700 reactions and describes the biochemical pathways from carbon fixation to the synthesis of cellular building blocks (Figure: Knoop et al., 2013)

As scientific mentor of the EXIST Business Start-Up Grant "CellDeg", the research group was involved in studying cultivation of cyanobacteria at very high cell densities (Picture: CellDeg GmbH).

Contribution to research networks

BENEDIKT BECKMANN

Molecular infection biology
<http://www.beckmannlab.de/>

Description of the projects:

We are using classical molecular biology methods in combination with bioinformatics to investigate RNA-protein interactions and its impact on infection to understand the post-transcriptional response of pathogen & host cell upon infection. Applying state-of-the-art systems biology approaches such as mRNA interactome capture, we analyse how *Salmonella* Typhimurium infection changes (m)RNP composition in macrophage host cells and the bacterium itself.

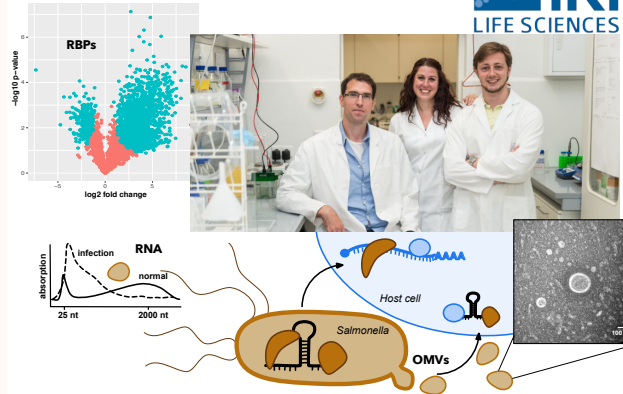

During infection, bacteria 'inject' effector proteins into the host cell which hijack cellular defense pathways of innate immunity and allow the pathogen to survive in macrophages and other cell types. It remains unclear if RNA-binding proteins (RBPs) are among these effectors. We are searching for such cross-species RNA-protein interactions and we are interested to learn if such bacterial RBPs are also able to interfere with the hosts' posttranscriptional response to the infection.

Selected publications:

SIMONE REBER

Quantitative biology

<http://www.thereberlab.com/>

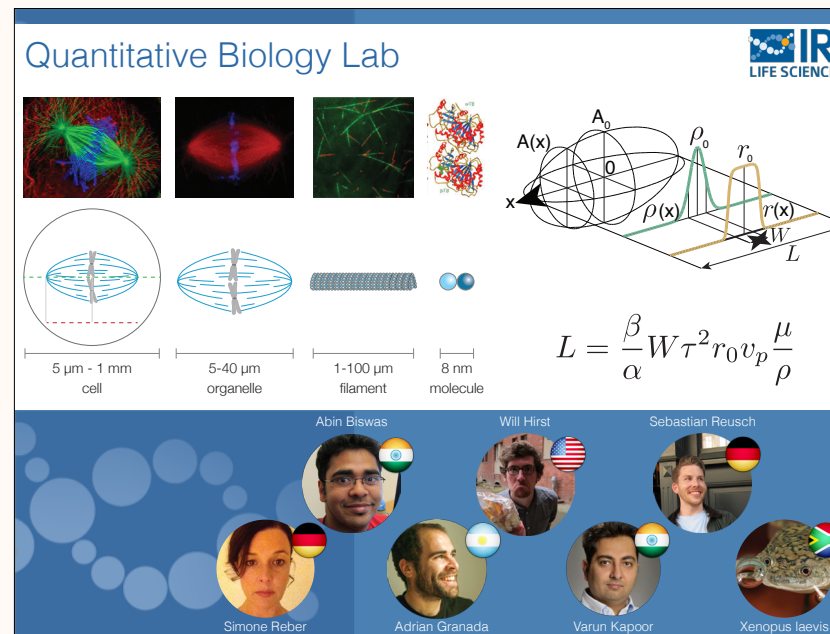

Description of the projects:

The Quantitative Biology Lab is an international team with backgrounds in biology, biochemistry, physical medicine, and mathematics. Our goal is to elucidate the biochemical and biophysical principles that underlie the self-organization and scaling of subcellular organelles. Each cellular organelle carries out a distinct function, which is not only related to its molecular composition, but in many cases also to its size. The mitotic spindle for example must be large enough to span sufficient distance to physically separate chromosomes into two opposite halves of the cell. In particular, we wish to understand the organizational principles that determine the size and the shape of the metaphase spindle. To understand the higher-order structure and dynamics of the metaphase spindle we need to study and link processes on several hierarchical length scales spanning a size range from single molecules to cells.

MATTHIAS KÖNIG

Systems medicine of the liver

<https://itb.biologie.hu-berlin.de/wiki/groups/koenig/start>

Description of the projects:

The liver is the metabolic hub of the body with a central role for metabolic homeostasis and detoxification of drugs and xenobiotics. The quantification of this liver function is indispensable to determine the functional status of the liver (e.g. in liver transplantation and resection), the alterations due to liver impairment and alteration (e. g. in liver disease like cirrhosis), or the success of interventions (e. g. medication).

Within the research network LiSyM we investigate with computational models of the liver which factors and processes influence hepatic function from the single cell, over the tissue up to the whole organ. We analyse the role of metabolism, perfusion and structure for liver function, and gain insights in the biological mechanisms underlying liver function.

A central objective is the development of a multiscale-model of the liver for the improved evaluation of quantitative liver function tests in the clinics. The model will be personalized using clinical and imaging data, as well as information about gender, age, bodyweight and height providing means for the individual evaluation of liver function tests.

More information under www.livermetabolism.com.

Mathematical modeling of liver metabolism and analysis of metabolic networks of the liver. The developed computational models are personalized and applied for the individual prediction of liver function.

MARCUS KRANTZ

The molecular basis of cellular decision making

<https://www2.hu-berlin.de/biologie/theorybp/index.php?goto=rxn>

Description of the projects:

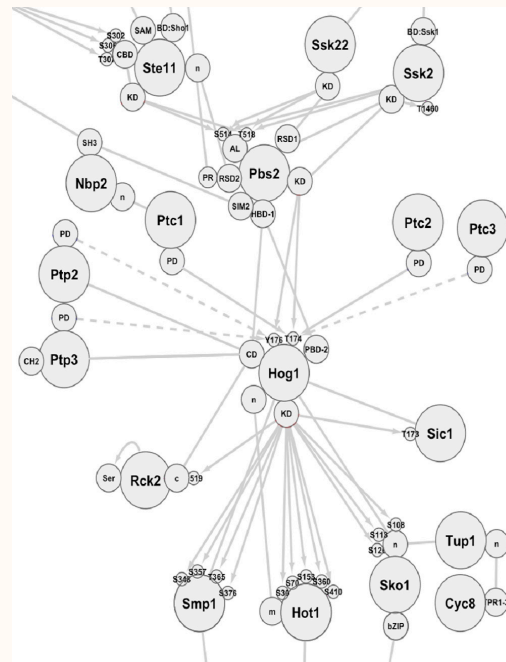

The objective of our project is to understand how cells take decision. To understand cellular decision making, we need to understand the molecules that sense, transmit and process information in the cell. These molecules interact in networks that play pivotal roles in health and disease: They monitor the state of the cell and its surrounding, and control key cellular processes. Failure in these networks leads to some of the most important diseases our health care system faces, including cancer and type II diabetes, and if we can understand these networks in detail they would provide excellent targets for pharmaceutical intervention. However, these networks are highly complex and difficult to understand without relying on computer simulations. Furthermore, the knowledge we have from experiments are often sparse.

Selected publications:

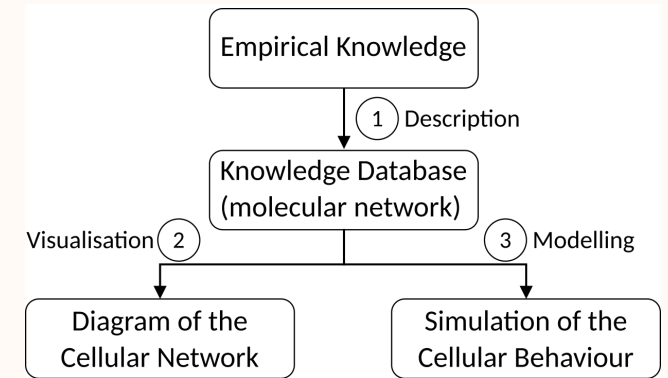

Lubitz T, Welkenhuysen N, Shashkova S, Bendrioua L, Hohmann S, Klipp E, Krantz M (2015) Network reconstruction and validation of the Snf1/AMPK pathway in baker's yeast based on a comprehensive literature review, *npj Systems Biology and Applications* 1. doi:10.1038/npjbsa.2015.7.

Tiger CF, Krause F, Cedersund G, Palmér R, Klipp E, Hohmann S, Kitano H, and Krantz M (2012) A framework for mapping, visualisation and automatic model creation of signal transduction networks. *Mol Syst Biol*, 2012. 8: 578. doi: 10.1038/msb.2012.12.

To tackle these problems, we develop methods to describe these networks at the level of detail that they are known from empirical data, to visualise this information, and to turn the knowledge into computational models. These models can be used to simulate the network function in order to better understand how the interplay between components and processes shapes cellular decision making.

The knowledge we have about the decision making processes corresponds to a network of components that the cells use to transmit and process information. In this case, the components are proteins that transmit information by binding to and/or modifying each other. We can capture this information at the resolution it is known, down to the role of specific parts of the proteins. However, to understand cellular decision making, we need to know more than the pairwise relationship between components: We need to understand how the different parts and processes in the network interact to shape a system level function.

To tackle these challenges, we develop methods at three levels. First, a language that makes it possible to formalise – exactly and efficiently – the molecular knowledge we have about these cellular networks from empirical data. Second, we design methods for visualisation that makes this knowledge easily accessible for users. Third, we develop a software that can convert the knowledge base into computational models that can be used to simulate the decision making process. Together, these methods make it possible (1) to formalise a detailed description of these networks into a knowledge base, (2) to visualise the network, as well as to use the knowledge base (3) to generate models for computational analysis of the network.

Contribution to research networks

Structure and dynamics of biomolecules

<http://www.igzev.de/mitarbeiter-listenansicht/?id=116>

Description of the projects:

We study protein structure and dynamics using nuclear magnetic resonance in the solid state (solid-state NMR) and a variety of other biophysical methods. In the last decade, solid-state NMR has emerged as a powerful technique in structural biology as it gives access to structural information for systems that are insoluble or do not crystallize easily. Furthermore, the technique allows for the characterization of chemical details (e.g. protonation of side chains) and functionally important protein dynamics. For solid-state NMR investigations, samples are placed in a strong superconducting magnet (external field up to 20 T, i.e. ~400,000 times stronger than the earth's magnetic field), spun rapidly (up to 100,000 rotations per second; magic-angle spinning), and probed by radio waves. In our group, one focus is on bacterial nanomachines that are involved in infection processes. Furthermore, we characterize membrane proteins in a lipid bilayer environment, for instance non-selective cation channels and rhomboid intra-membrane proteases. Last but not least we continue to develop new solid-state NMR methods.

WERNER KLOAS

Endocrinology and department of ecophysiology and aquaculture at the Leibniz-Institute of Freshwater Ecology and Inland Fisheries

<http://www.igb-berlin.de/endept-5-ecophysiology-and-aquaculture>

Description of the projects:

The main interest is to understand and unravel the endocrine functions of aquatic vertebrates e. g. fishes and amphibians and their impacts on physiology affecting reproduction, development, behavior and metabolism. Endocrine research is used as basis for application in ecotoxicology and sustainable aquaculture. One emerging threat in ecotoxicology are the so-called endocrine disruptors (ED), synthetic and natural compounds disrupting normal endocrine functions, revealing impacts on reproduction, behavior and development. The introduction of amphibians as model organisms to study ED is one of the major tasks being accomplished by a broad range of endocrinological research tools. Sustainable aquaculture of fishes has many facets triggered by endocrine systems such as reproduction, development and stress, the latter one associated with animal welfare. All these aspects of sustainable aquaculture are focusing on recent research in the context of integrating aquaculture and horticulture by using our innovative aquaponic system ("tomatofish") in order to contribute to food security.

Contribution to research networks

Project leader of the EU-project INAPRO (Innovative aquaponics for professional application 5.9 Mill. €; 1.1.2014-30.6.2018) focusing on aquaponics, a sustainable food production technology that couples fish production and soilless vegetables production in one system.

The double recirculation system provides optimised conditions for the fish and plant part independently from each other to increase the productivity of both.

The project develops production scaled INAPRO aquaponic facilities to demonstrate resource efficient, thus contributing remarkably to the 21st century's global food security.

Special professorship

PHILIPP FRANKEN

Molecular phytopathology

http://www.igzev.de/portfolio_type/portfolio-philipp_franken/?lang=en

Description of the projects:

The mineral nutrient supply of plants is the basis of plant growth. Many plants accomplish this supply in partnership with mycorrhizal fungi which receive in return carbohydrates. On the one hand, we analyze the regulation of fungal mineral uptake from substrates and hyphal transport of these resources towards the plant. On the other hand, we contribute to our understanding of carbon fluxes from photosynthesis over distribution inside the plant up to fungal metabolism.

Soil-borne pathogens are difficult to confine and little is known about their interaction with plants. Roots colonized by mycorrhizal fungi are more resistant against such pathogens. We identify plant genes that are specifically expressed when roots are protected by mycorrhizal fungi. These candidate genes will then be functionally characterized.

Selected publications:

Mycorrhizal fungus in root organ culture: fungal hyphae outside of the root (left) and colonized root (right)

Contribution to research networks

BestPass: Boosting plant-endophyte stability, compatibility and performance across scales, a 'Marie Skłodowska-Curie

Innovative Training Network', 2015-2020.

Plant endophytic microorganisms can improve plant yield and enhance plant tolerance to abiotic stress as well as to pathogens under experimental conditions, but these effects are often not sufficiently stable for practical application. The BestPass project will address these concerns.

How do we boost the stability and reliability of the positive effects of endophytes on plants?

We need to:

- understand the genetic basis of beneficial interactions between crops and endophytes
- extend this basic knowledge at all interaction levels from the cellular to the field environment

This requires increasing our knowledge of the mechanisms underlying the effects of endophytes:

- intra and inter-kingdom exchange and distribution of resources (nutrients)
- signalling and possibly regulation between and inside the partners
- the mutually induced production of secondary metabolites
- the environmental cues which influence crop-endophyte interactions.

The genetic variation and its plasticity in host and microbe will be exploited to establish crop breeding and inoculum production processes for boosting the establishment and stability of plant-microbe mutualisms to benefit crop development, stress tolerance, pathogen resistance and quality.

Special professorship

EMANUEL HEITLINGER

Ecology and evolution of molecular parasite-host interactions

<https://www.biologie.hu-berlin.de/de/gruppenseiten/ecoevolpara/>

Description of the projects:

We use the hybrid zone of the two subspecies of the house mouse, which often determines population structure of parasites, as a natural laboratory for adaptations and coevolution. Wild house mice (and their laboratory strain cousins) are an approachable model host in both the field and the laboratory.

Geographic distribution of subspecies of the house mouse and their parasites

As our main parasite model we use protozoans of the genus *Eimeria*, which features host specific parasites. *Eimeria* is the largest genus in the phylum Apicomplexa (a phylum also containing human pathogens *Plasmodium* spp. *Toxoplasma gondii*). My group tests coevolution: reciprocal adaptation of *Eimeria* and the house mouse.

Parasites in a schematic food chain

It is often necessary to go beyond a „one host one parasite“ system to infer adaptation. We want to include the whole parasite community of a host species and its ecology in the analysis. To this end we develop DNA-sequencing based high throughput methods to investigate non-invasive samples (i.e. fecal samples) for the presence and abundance of eukaryotes (the eukaryotic biome) and its correlation with the bacterial microbiome.

We develop wet-lab approaches (primers and probes) and solutions for bioinformatic data analysis to make full use of the generated information. We aim to construct host-parasite links and food webs and to test the influence of this integrative ecosystem features on animal species and whole ecosystems.

Selected publications:

Totta Ehret, Simone Spork, Christoph Dieterich, Richard Lucius and Emanuel Heitlinger (2017) Dual RNA-seq Reveals No Plastic Transcriptional Response Of The Coccidian Parasite *Eimeria falciformis* To Host Immune Defences. *BMC Genomics* 18(1):686.

Emanuel Heitlinger, Susana C Ferreira, Dagmar Thierer, Heribert Hofer and Marion L East (2017) The intestinal eukaryotic and bacterial biome of spotted hyenas: the impact of social status and age on diversity and composition. *Frontiers in Cellular and Infection Microbiology* 7, 262.

Contribution to research networks

As part of the Leibniz-Institute for Zoo and Wildlife Research (Leibniz-IZW) we contribute to study the diversity of life histories and evolutionary adaptations and their limits (including diseases) of free-ranging and captive wildlife species, and their interactions with people and their environment in Germany, Europe and worldwide.

As part of the Berlin-Canberra alliance we address fundamental issues in malaria through an International Research Training Program (IRTG 2290). We want to contribute to molecular insights into *Plasmodium* infections, which we hope can generate novel evidence-based strategies to develop curative and prophylactic drugs, and immunization strategies that elicit lasting protection against the disease.

As part of GRK 2046 we help to install a cutting edge and integrative curriculum to educate “next-generation” parasitologists. We train graduates in molecular approaches and organismic studies. In accordance with the “One Health” concept different parasite infections are studied from the biological, medical, and translational perspectives.

IRTG2290 and GRK 2046 are both funded by DFG. In addition DFG funding is received for the projects described above in collaboration with colleagues from the University of Edinburgh (Konrad Lohse) and the Czech Academy of Sciences (Jollee Gouy de Bellocq, Jaroslav Pialek und Stuart Baird).

Special professorship

MARKUS LANDTHALER

RNA biology and posttranscriptional regulation

<https://www.mdc-berlin.de/landthalerlab>

Description of the projects:

Regulation of gene expression takes place at multiple steps along the life cycle of an mRNA molecule from transcription to protein translation. These processes are regulated mainly by RNA-binding proteins that recognize cis-regulatory elements on transcripts, to form ribonucleoprotein (RNPs) complexes with mRNAs. The structure and dynamics of RNPs define the spatial and temporal mRNA transcript abundance. It is evident that the combination of RNP-mediated regulatory events has a direct impact on protein isoform diversity and abundance, suggesting that mRNA is an important source of biological variation.

mRNA-bound proteome of HEK293 cells

Arbeitsbereich_1.jpg

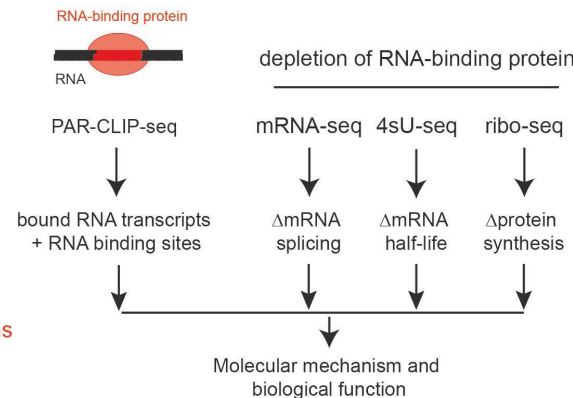

The Landthaler lab is interested in system-wide understanding of posttranscriptional regulation in mammalian cells in response to changes in their immediate environment. To this end, the lab uses biochemical and transcriptome-wide approaches to study protein-mRNA interactions in combination with high-throughput expression studies.

Selected publications:

Milek M, Imami K, Mukherjee N, De Bortoli F, Zinnall U, Hazapis O, Trahan C, Oeffinger M, Heyd F, Ohler U, Selbach M, Landthaler M. (2017) DDX54 regulates transcriptome dynamics during DNA damage response. *Genome Research* 27,1-16.

Characterization of RNA-binding proteins

Contribution to research networks

Marie Curie International Training Network “RNAtrain” (rna.train.ku.dk/): The network focuses on the functions of non-coding RNAs (ncRNAs) in multidisciplinary projects in the context of development, differentiation and disease. The projects span from the identification of ncRNAs in selected model systems, over functional annotation of ncRNAs to a range of biochemical and genetic functional analyses.

Research Training Group 1772: Computational Systems Biology (<http://www.berlin-csb.de/>). The goal of this graduate school is the development of new theoretical concepts and their application to current problems in cell biology. The research focuses on reverse engineering of biological networks, understanding of cellular variability, adaptation mechanisms in biological networks and regulatory mechanisms mediated by RNA molecules.

Federal Ministry of Education and Research e:Med CaRNation: This project includes the analysis of splice factor function and regulation as a basis for therapeutic decisions and the development and evaluation of splice directed therapeutics in engineered heart muscle from patient derived differentiated iPSCs towards personalized diagnosis and therapy.

Priority program 1935: This Priority Programme aims to “decipher the mRNP code” of eukaryotes. Researchers from disciplines as diverse as systems biology, biochemistry, structural biology and bioinformatics develop methods allowing insight into the composition of mRNPs and their function in specific cellular settings of gene expression.

Special professorship

ACHIM LEUTZ

Cell differentiation and tumorigenesis

https://www.mdc-berlin.de/1152580/de/research/research_teams/cell_differentiation_and_tumorigenesis

Description of the projects:

A set of hematopoietic transcription factors controls self-renewal, cell lineage commitment, and differentiation of innate immune cells, including granulocytes and macrophages. Dysregulation of such essential transcription factors may cause leukemia. The CCAAT enhancer binding proteins alpha and beta (C/EBP α,β) are pioneer factors that specify cell fate and proliferation by regulating gene expression and the structure of chromatin. C/EBP α,β are also involved in the leukemic conversion of hematopoietic progenitors. C/EBP α,β are heavily decorated with signal dependent post-translational modifications (PTM). Experimental abrogation of distinct PTM alters both, the C/EBP α,β interactome and regulatory capacity in hematopoiesis. Accordingly, a “PTM-Indexing Code” determines essential C/EBP α,β functions and our research focuses on the molecular mechanisms involved. We employ targeted mouse genetics, experimental hematopoiesis, genetic engineering of somatic cells in vitro, proteomics, and biochemistry to disclose the gene regulatory, epigenetic, and the pathologic functions of C/EBP α,β .

Scheme of hematopoiesis and leukemogenesis. Hematopoietic stem cells (HSC, on the top) can self renew (circular grey arrow) and give rise to multi-potential progenitors (MPP) that commit to different lineages, as indicated. Progenitor and precursor populations represent highly proliferative transit amplifying populations that generate functionally differentiated blood cells. Genetic accidents (mutations and epigenetic alterations) affecting key transcription factors that direct normal commitment and differentiation cascades (e.g. C/EBP, as indicated) may cause leukemic conversion (= cancer of the blood).

Contribution to research networks

CRC/TRR 167: Development, function and potential of myeloid cells in the central nervous system (NeuroMac) Berlin-Freiburg, Teilprojekt B11. Project title: Function of C/EBPs in monocytes, macrophages and microglia. A combination of mouse genetic and proteomic approaches to decipher C/EBP mediated neuroimmune functions during healthy and inflammatory conditions.

Special professorship

UWE OHLER

Computational regulatory genomics

<https://ohlerlab.mdc-berlin.de>

Description of the projects:

The expression of genes is a multi-step process that is tightly controlled on several levels — a large number of protein and RNA factors and DNA and RNA sequence elements enable the precise regulation of interacting gene products. In multicellular organisms, this complexity is not achieved by increasing numbers of parts, i. e. genes, but instead by the more intricate regulation of the parts.

It is a key challenge to decipher these complex regulatory networks, and how they enable the development of complex organisms with many cell types that carry out different functions despite the same genome. To this end, we use high-throughput genomics approaches to generate quantitative data and develop computational methods that use diverse sources of molecular information; we frequently frame questions as classification problems and apply machine learning approaches to make testable predictions.

Selected publications:

Velasco S, Ibrahim MM, Kakumanu A, Garipler G, Aydin B, Al-Sayegh MA, Hirsekorn A, Abdul-Rahman F, Satija R, Ohler U, Mahony S, Mazzoni EO. A Multi-step Transcriptional and Chromatin State Cascade Underlies Motor Neuron Programming from Embryonic Stem Cells. *Cell Stem Cell*. 20:205-217, 2017.

Calviello L, Mukherjee N, Wylter E, Zauber H, Hirsekorn A, Selbach M, Landthaler M, Obermayer B, Ohler U. Detecting actively translated open reading frames in ribosome profiling data. *Nat Methods* 13:165-70, 2016.

(A) To understand developmental processes at the molecular level, high-throughput experiments can determine detailed information on gene regulation. Here, embryonic stem cells are converted to motor neurons via the expression of three transcription factors (NIL: Ngn2, Isl1, Lhx3), and the changes of transcription factor binding, chromatin accessibility, histone modifications, and gene expression are profiled from 0-48 hours. (B) Computational models can be used to determine patterns in the data. Here, promoters of genes are clustered by means of a probabilistic model that takes genome-wide data across multiple time points as input. (C) The resulting clusters fell into three broad classes, up-regulated, down-regulated, and constant, and are composed of genes with different functions [Velasco et al, 2017].

Contribution to research networks

CRC/TR 175: The Chloroplast as Central Coordinator of Acclimation in Plants. Plants continuously acclimate to changes in their environment. Within their cells, chloroplasts sense environmental changes and control cellular responses. Our consortium aims to discover how plants translate changes in light and temperature into cellular responses and to identify the central molecular switches behind this process.

Research Training Group 1772: Computational Systems Biology. This graduate training program aims at the development and application of new theoretical concepts of systems biology.

Priority program 1935: At all stages of their life, messenger RNAs interact with trans-acting factors, including proteins and non-coding RNAs, to form ribonucleoproteins (RNPs). Participating groups develop and apply methods allowing insight into the composition of mRNPs, how they are assembled and remodelled, and how they function in specific cellular settings.

BMBF de.NBI German Network for Bioinformatics Infrastructure: RNA Bioinformatics Center. de.NBI is a national infrastructure providing comprehensive, high-quality bioinformatics services to users in life sciences research and biomedicine. Together with groups in Freiburg and Berlin, we are coordinating the RNA-focused efforts within the network.

Federal Ministry of Education and Research e:Bio CaRNation: Cardiac RNA processing as a basis for therapeutic decision and intervention. Alternative splicing determines which exons are included in the mature RNA, and its misregulation has been found to play crucial roles in many diseases. Utilizing existing clinical and molecular information in addition to cardiac patient samples and iPSCs, this project aims at RNA-guided molecular functional diagnostics and therapy.

Special professorship

ANA POMBO

Transcriptional regulation and genome architecture

https://www.mdc-berlin.de/40791582/de/research/research_teams/epigenetic-regulation-and-chromatin-architecture

Description of the projects:

We investigate the interplay between gene regulation and three-dimensional genome architecture, towards defining the principles of genome function. We study multiple levels of regulation from the local action of transcription factors, the role of Polycomb repression and RNA polymerase II regulation, to the long-range mechanisms of gene regulation through chromatin looping between non-coding regulatory DNA sequences (enhancers) and genes. We develop new technologies to map the 3D chromatin folding, namely Genome Architecture Mapping (GAM). We have identified a complex network of non-random contacts that involve enhancers and active genes which span whole chromosomes and are cell-type specific. We currently study the functional role of these contacts in neuronal cell types, the embryo, and genomic rearrangements associated with congenital disease.

THOMAS SOMMER

Intracellular proteolysis

https://www.mdc-berlin.de/1154933/en/research/research_teams/intracellular_proteolysis

Description of the projects:

In all cells, both newly synthesized and pre-existing proteins are constantly endangered by misfolding and aggregation. The accumulation of such damaged proteins perturbs cellular homeostasis and provokes aging, pathological states, and even cell death. To avert these dangers, cells have developed compartment-specific protein quality control (PQC) strategies that include proteolytic digestion. Central to the understanding of PQC pathways is the Ubiquitin Proteasome System (UPS).

Protein homeostasis in the Endoplasmic Reticulum (ER). Proteins transported into the ER associate with molecular chaperones and only correctly folded proteins can leave the ER for their final destinations. Misfolded proteins are retained in the ER and are either subjected to re-folding, or are dislocated from the ER for destruction by the Ubiquitin Proteasome System (UPS). The UPR measures the content of misfolding in the ER, signals it to the nucleus, and up-regulates chaperones and UPS components of the ERAD branch.

Our work focuses on how specific combinations of Ubiquitin Conjugating (E2) enzymes and Ubiquitin Ligases (E3) selectively recognize and dispose aberrant proteins without affecting correctly folded polypeptides. Our analysis includes biochemical and biophysical approaches, molecular and genetic analysis, structural investigations (in cooperation), and proteome-wide screens. We work in vitro, in yeast, in cell culture systems, and in *C. elegans* and Zebrafish (both in cooperation). Our results have implications for a wide variety of diseases like cancer, cardiovascular diseases, and neurodegeneration.

Besides biochemical approaches with purified components we use yeasts or cell culture systems as experimental tools.

Contribution to research networks

DIP grant (Deutsch-Israelische Projektkoordination): joined project group with PI's from Technion-Israel Institute of Technology, University of Cologne and Humboldt Universität zu Berlin. The Title of the Project is „Challenging the Ubiquitin Proteolytic Signal - Novel Modes of Modification and Recognition“.

CRC740: This CRC is devoted to the analysis of functional cellular modules. These module are defined as a subset of the cellular macromolecules required to execute an autonomous function. In our project B5 we are focusing on substrate recognition by the HRD-ubiquitin ligase.

Special professorship

JÖRG FRÖBISCH

Paleobiology and evolution

<https://www.naturkundemuseum.berlin/en/einblicke/mitarbeiter/joerg.froebisch>

Description of the projects:

The origin and early evolution of amniotes, the clade that includes all fully terrestrial tetrapods, led to major changes in the structure and hierarchy of terrestrial vertebrate ecosystems, including the evolution of high-fiber herbivory, entirely new locomotor strategies such as climbing and flying, and ultimately the evolution of more complex terrestrial ecosystems and the modern trophic pyramid. The research of my lab focuses on the patterns of diversification, phylogeny, and paleobiology of early amniotes. The application of a number of different approaches combines paleontological fieldwork with modern techniques (3D-imaging) and quantitative methods to shed new light on the initial diversification patterns of amniotes, the evolution of key innovations and body plans, the evolution of vertebrate ecosystems, as well as the impact of mass extinction events on terrestrial ecosystems, with the focus on their vertebrate fauna.

Selected publications:

Brocklehurst, N., Day, M. O., Rubidge, B. S., and Fröbisch, J. (2017) Olson's Extinction and the latitudinal biodiversity gradient of tetrapods in the Permian. – *Proceedings of the Royal Society B* 284: 20170231.

Cisneros, J. C., Marsicano, C., Angielczyk, K. D., Smith, R. M. H., Richter, M., Fröbisch, J., Kammerer, C. F., and Sadleir, R. (2015) New Permian fauna from tropical Gondwana. – *Nature Communications* 6: 8676.

Skeleton of the early mammal relative *Suminia getmanovi* from the upper Permian Kotel'nich locality (260 Ma), Russia; from the collection of the Paleontological Institute, Russian Academy of Science, Moscow.

Contribution to research networks

Sofja Kovalevskaja Programme: “Early Evolution and Diversification of Synapsida”. The Sofja Kovalevskaja Award, granted by the Alexander von Humboldt Foundation and funded by the Federal Ministry of Education and Research, is granted to young exceptionally promising researchers from abroad in recognition of outstanding academic achievements to establish their own research groups in Germany. This research focuses on the patterns of morphological and ecological diversification, phylogeny and paleobiology of one of the two major clades of amniotes, the Synapsida, the clade that ultimately led to the evolution of mammals, utilizing a number of different approaches, combining paleontological fieldwork with modern techniques (3D-imaging) and quantitative methods.

DFG-grant: “Late Paleozoic Tetrapod Biogeography”. The late Palaeozoic represents a crucial period in the evolution of terrestrial vertebrate ecosystems when more complex community structures with intricate trophic hierarchies were established. Here we test certain hypotheses regarding the early patterns of tetrapod biogeography through time with quantitative biogeographic methods.

DFG-grant: “Anatomy, Ecology and Ontogeny of Mesosaurs using 3D-Imaging Technologies”. Mesosaurs are a unique and very specialized vertebrate group, representing the first fully aquatic amniotes, exclusively known from the early Permian of southern Gondwana. Here we investigate the detailed anatomy, taxonomy, ontogeny, phylogeny and functional morphology of mesosaurs using modern 3D imaging technologies from CT data.

Special professorship

NADIA FRÖBISCH

Development and evolution

<https://www.naturkundemuseum.berlin/en/einblicke/mitarbeiter/nadia.froebisch>

Description of the projects:

The research focus in the N. Fröbisch lab is on the evolution and development of amphibians. Due to their 350 Ma long evolutionary history, their enormous diversity in extinct and extant ecosystems as well as their impressive ontogenetic plasticity amphibians lend themselves particularly well for an integrative research program. In my lab we combine paleontological, developmental and morphological approaches whereas individual aspects build upon each other with the aim to integrate the genetic basis of developmental processes, the anatomy of extinct and extant organisms, and their interaction with the (paleo)ecosystem. Currently we focus on the early evolution of modern amphibians, limb development and regeneration, and cell size evolution in amphibians.

Selected publications:

Fröbisch, N. B., C. Bickelmann, J. C. Olori & F. Witzmann (2015) Deep-time evolution of regeneration and preaxial polarity in tetrapod limb development. *Nature*, 527, 231.

Fröbisch, N. B. & N. H. Shubin (2011) Salamander limb development: Integrating genes, morphology, and fossils. *Dev. Dyn.*, 240, 1087.

Zwei fossile Dissorophoiden, *Micromelerpeton* (größeres Tier) und *Apateon* (kleineres Tier), von der Stammlinie der modernen Amphibien. Unteres Perm (290 MA), Saar-Nahe Becken; aus der Sammlung des Museums für Naturkunde.

Contribution to research networks

Universidade de São Paulo (USP) and the Humboldt-Universität zu Berlin (HU) Strategic Partnership Initiatives “Evolution of limb reduction and regeneration in salamanders”. The research program surrounds a hallmark in tetrapod body plan evolution – the limb. We aim to investigate the evolution and development of limb diversity in salamanders, using an integrative approach that combines phylogenetic mapping of autopodial morphology with analyses of molecular signatures. The Partnership Initiative with Prof. Tiana Kohlsdorf (Universidade de São Paulo) provides funds for travel and exchange to facilitate transfer of skill and initiate joint funding applications and student supervisions.

Emmy Noether Program “Amphibian origin(s) and evolution through deep time: integrating the fossil record, morphology, and development”: The DFG Emmy Noether program supports scientists in establishing an independent research group

and provides funding for the group leaders as well as PhD students and associated costs for 5 years. The project takes an integrative approach and entails approaches from vertebrate paleontology, morphology and evolutionary developmental biology to understand the evolution of modern amphibians (frogs, salamanders and caecilians). Currently two PhD projects as well as a technical assistant are supported through the project.

DFG grant “The evolution of regenerative capacities in tetrapods considering extant and fossil taxa”. Among modern four legged vertebrates only salamander can regenerate their limbs fully and repeatedly throughout their entire life and much research effort is invested to understand the underlying molecular program largely based on the axolotl. This project investigates patterns of regeneration in different salamander taxa and at various ontogenetic stages using a histological approach as well as comparative transcriptomics to gain a broad evolutionary perspective on limb regeneration across taxa and geologic time scales. One PhD project is currently funded through the project.

HANNELORE HOCH

Systematic zoology

<http://www.naturkundemuseum-berlin.de>

<https://orcid.org/0000-0001-6439-9645>

Description of the projects:

Our research focuses on the taxonomy, systematics and evolutionary biology of insects, especially the Hemiptera which contain numerous species of significant ecological and economic importance. We are interested in the processes underlying the evolution of biodiversity as well as in all aspects of Hemipteran biology, including descriptive and functional morphology, mating behaviour, sensory structures, ecology, adaptation to extreme habitats such as caves. Apart from classical comparative morphology, we apply laser-vibrometry to record the surface-borne vibrational signals which play an important role in mate recognition in species of small body-size, and 3D-reconstructions based on high-resolution μ CT data to better understand select organs in their organismic context. Since the diversity of the Hemiptera is vast and still insufficiently documented, we are contributing formal descriptions of Hemiptera species new to science.

Selected publications:

Hoch, H., Wessel, A., Asche, M., Baum, D., Beckmann, F., Bräunig, P., Ehrig, K., Mühlethaler, R., Riesemeier, H., Staude, A., Stelbrink, B., Wachmann, E., Weintraub, P., Wipfler, B., Wolff, C. & Zilch, M. 2014. Non-sexual abdominal appendages in adult insects challenge a 300 million year old bauplan. – *Current Biology* 24(1): 16-17.

Contribution to research networks

Zuse Institut Berlin

<http://www.zib.de/projects/reconstruction-and-visualization-anatomical-structures-insects>

High-resolution synchrotron μ CT allows the study of insect anatomy in a non-destructive way, even of delicate structures such as the nervous system. This is particularly important for rare specimens. However, the high resolution of the images as well as the complex anatomical structures of insects represent a challenge for segmenting and visualizing the specimens. In this project, we try to address these challenges, especially to support comparative visualization.

International Biotremology Initiative

<https://eventi.fmach.it/biotremology2018/>

The International Biotremology Initiative aims to bring together the community studying vibrational communication in all animal taxa to strengthen collaborations, to develop new ideas and research, and to form a strong supportive network for the emerging field of Biotremology.

Special professorship

JOHANNES MÜLLER

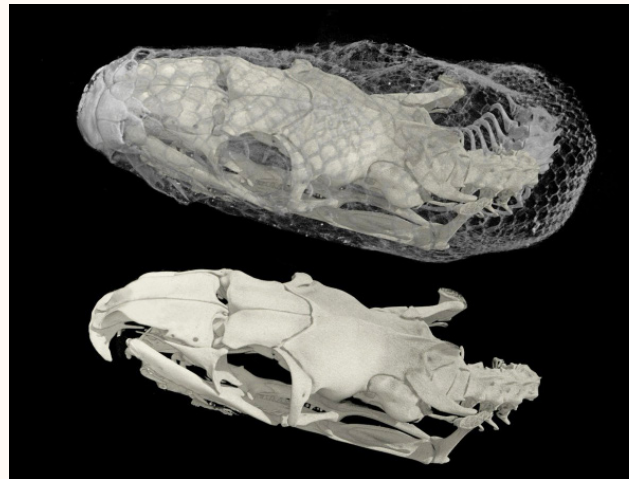

Paleozoology

<https://muellerlaboratory.wordpress.com/>

Description of the projects:

The research of my lab concentrates on fossil and extant terrestrial vertebrates, particularly lizards and snakes, but also mammals. We are especially interested in the underlying causes of evolutionary diversification, both at the taxic and morphological levels and at variable temporal scales. Our research projects involve extinct and extant systems, for which we employ phylogenetic, paleontological, molecular, and ecological methods. We have a special focus on 3D visualization and computed tomography (CT), and we use these techniques for both qualitative and quantitative studies of phenotypic evolution. Geographically we mostly focus on Europe and Africa, but recently also started studying systems in North America and Australia.

One major topic of my lab's research is the evolution of novel body plans, and in which way ecological factors contributed to their origin. We especially look at snake-like body forms using various clades of squamate reptiles as model systems, thereby also asking questions about the stability of developmental constraints under different eco-evolutionary scenarios. This research has also led us into general questions about the relationship between development and ecomorphological convergence. We usually approach these issues using personally generated, large-scale phenotypic 3D datasets of both fossil and extant species, as well as a solid phylogenetic foundation that we increasingly complement by phylogenomic sequencing.

Digital image of the skull of a sandboa snake (genus *Eryx*), with and without skin, as derived from computed tomography. One of the main tasks of our CT facility is to generate large-scale databases of phenotypic diversity, with special focus on reptiles and mammals, which are then used for macroevolutionary analyses.

Our second major topic involves the evolution of terrestrial vertebrate communities through time, where we put special focus on changes in trait diversity and phylogenetic composition. We are particularly interested in how Neogene and Quaternary global cooling and associated environmental changes affected community evolution, eventually resulting in the patterns seen today. Along these lines we also look into very recent phenotypic trait changes at the population and species levels, and to what extent anthropogenic influence, including climate change, may have played a role.

Complex systems

<http://rocs.hu-berlin.de/>

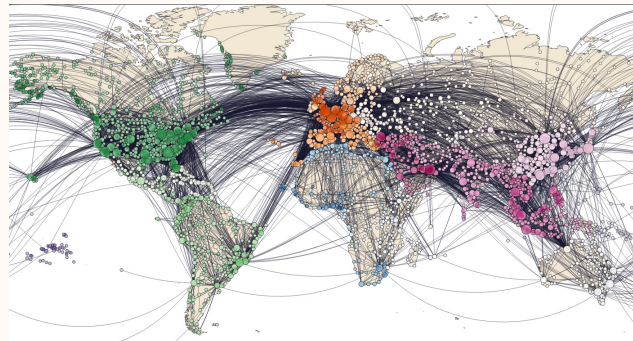

Description of the projects:

Our research is focused on the development of mathematical and computational models for complex dynamical phenomena in the life-sciences. A core area of our work is understanding dynamical processes that are mediated by network structures for example the global spread of emergent infectious diseases such as Zika, Ebola pandemic influenza and related phenomena. We also study disease dynamics in populations for example in inter-individual contact networks. One of the key questions we aim to address is what statistical and topological features of the underlying network shapes specific aspects of the spreading process. To answer these questions we develop theoretical methods and computational algorithms that try to reveal structures that are typically hidden in the complexity of connections in a network. We also develop quantitative forecast systems that are being applied in epidemic predictions. We connect different disciplines in our work following a trans-disciplinary approach, integrating methods from theoretical physics, computer science, biology, social sciences, and complex network theory.

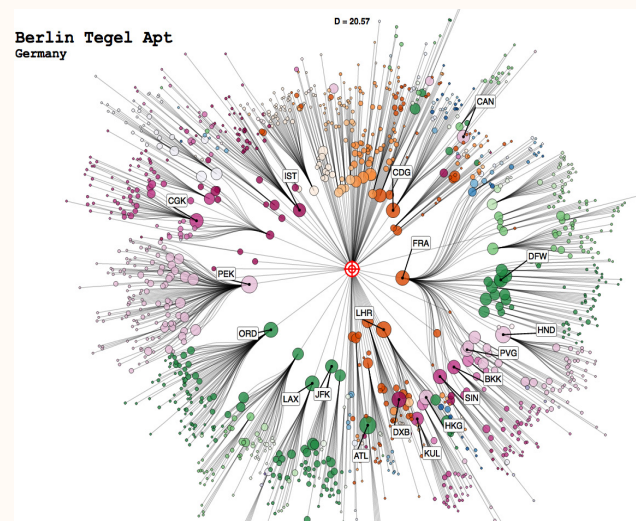

Selected publications:

Dirk Brockmann & Dirk Helbing, The hidden geometry of complex, network-driven contagion phenomena, *Science* 342, 1337. (2013)

Dirk Brockmann, Lars Hufnagel, Theo Geisel, The scaling laws of human travel, *Nature* 439, 462. (2006)

The global air-transportation network is the foundation of computer simulations that aim at predicting the global spread of emergent infectious diseases.

Complex network theory can identify the most probable spreading routes.

Contribution to research networks

Institute of Scientific Interchange (ISI):

External Faculty, Institute of Scientific Interchange, Turin. Analysis of complex social and biological networks and computational epidemiology.

Contribution to research networks

Robert Koch Institute: Head of the project group Computational Epidemiology at the Robert Koch Institute.

The Robert Koch Institute is the federal Public Health Institute for Germany responsible for epidemiological surveillance of notifiable infectious diseases and prevention.

IRI Life Sciences: The IRI for the Life Sciences at the Humboldt University is a collaborative research institute founded in collaboration with the Charité Hospital and the MDC with the goal of bridging theoretical and quantitative experimental approaches at multiple scales of biology, from molecules to cells to organisms and populations.

Affiliated Faculty, Northwestern Institute on Complex Systems (NICO): NICO was founded in 2004 aimed at basic research on complex systems ranging from computer science social science to biology and the life sciences. NICO is host to a broad range of young scientists and follows a trans-disciplinary research philosophy.

Cooperation and Collective Cognition Network (CoCCoN), Princeton University

and Humboldt Universität zu Berlin: The network brings together scientists from a broad range of disciplines, such as biology, psychology, sociology, economics and applied math. It provides an interdisciplinary environment for collaborative study of cooperation and collective cognition in human and animal systems, with the main research focus being behavioral contagion and the role of social norms on collective behavior. Hereby, analogies and differences between bio-ecological and socio-economical systems shall be discussed. A unique feature of the network is the direct exchange between empirical and theoretical research, which enables a close connection between mathematical modeling and experimental observation of relevant processes.

WOLFGANG UCKERT

Molecular cell biology and genetic therapy

<https://www.mdc-berlin.de/uckert>

Description of the projects:

Adoptive T cell therapy (ATT) to treat cancer requires the generation of antigen-specific T lymphocytes (T cells), which are able to recognize and eradicate tumor cells. While the use of tumor-infiltrating lymphocytes showed some therapeutic success for selected tumor entities, the utilization of T cells which are genetically engineered to express antigen-specific T cell receptors (TCRs) or chimeric antigen receptors (CARs) paves the way for a broader application of ATT. Our group focuses on different aspects of ATT:

1. Isolation and molecular cloning of TCRs and CARs that target tumor-specific antigens and are suitable tools for clinical studies.
2. Modification of T cells with genes encoding TCRs and CARs for their application in ATT to treat tumor-, virus-, and autoimmune diseases.
3. Development of pre-clinical mouse models to analyse the therapeutic efficacy of genetically engineered T cells and development of safety moduls to avoid side effects in ATT.
4. Optimization of viral and non-viral vector systems for the efficient genetic in vitro- and in vivo-engineering of T cells.

Selected publications:

Bunse, M., Bendle, G. M., Linnemann, C., Bies, L., Schulz, S., Schumacher, T. N., Uckert W. (2014). RNAi-mediated TCR knockdown prevents autoimmunity in mice caused by mixed TCR dimers following TCR gene transfer. *Molec. Ther.* 22 (11): 1983-1991.

Leisegang, M., Kammertoens, T., Uckert, W*, Blankenstein, T*. (2016) Targeting human melanoma neoantigens by T cell receptor gene therapy. *J. Clin. Invest.* 126 (3): 854-858, (*equal contribution).

Contribution to research networks

CRC/TR 36: Principles and application of adoptive T cell therapy. In two projects of this consortium we are working on safety aspects of ATT using TCR-engineered T cells (A12) and support other groups to generate TCR and CAR gene-modified T cells (Z1).

CRC 650: Cellular approaches to a suppression of unwanted immune reactions. In this consortium we redirect the antigen specificity of regulatory T cells by transfer of TCR and CAR genes.

Berlin Institute of Health Collaborative Research Grant: Targeting somatic mutations in human cancer by T cell receptor gene therapy.

In this consortium we characterize the sensitivity and specificity of TCRs isolated from transgenic mice (cooperation with T. Blankenstein, Max Delbrück Center for Molecular Medicine (MDC) and Hans Schreiber, University of Chicago) and analyse their ability to reject established tumors in pre-clinical mouse model.

Schematic presentation of TCR- and gene therapy. T cells of a cancer patient were isolated and engineered with TCR- or CAR genes, which are able to specifically recognize and destroy tumor cells. TCR- or CAR modified tumor reactive T cells were expanded and reinfused into the cancer patient.

Description of the projects:

Structure and mechanism of canonical ABC import systems in prokaryotes

The family of ABC („ATP-Binding Cassette“) transport systems comprises an extremely diverse class of membrane transport proteins that couple the energy of ATP hydrolysis to the translocation of solutes across biological membranes. Members of this family not only accomplish the uptake of nutrients but are involved in a large variety of processes, such as signal transduction, protein secretion, drug and antibiotic resistance, antigen presentation, bacterial pathogenesis and sporulation. ABC transporters have been identified in organisms belonging to each of the three major kingdoms of life (bacteria, archaea and eukarya, including man), and thus might be considered as an ancient proteinaceous device for solutes to pass a lipid bilayer against a concentration gradient. We study the structure and function of canonical (binding protein-dependent) ABC importers from various bacteria and archaea by molecular biological, biochemical and biophysical means.

Model of the Transportzyklus' of ABC-import systems (type I)

Selected publications:

Böhm, S., Licht, A., Wuttge, S., Schneider, E., and Bordignon, E. (2013) Conformational plasticity of the type I maltose ABC importer. *Proc Natl Acad Sci (USA)* 110, 5492-5497.

Yu, J., Ge, J., Heuveling, J., Schneider, E., and Yang, M. (2015) Structural basis for substrate specificity of an amino acid ABC transporter. *Proc Natl Acad Sci (USA)* 112, 5243-5248.

Contribution to research networks

Interdisciplinary Centre for Educational Research

ANNETTE UPMEIER ZU BELZEN

<https://zentrum-bildungsforschung.hu-berlin.de/de/izbf/standardseite>

Description of the projects:

Board of Directors: Annette Upmeier zu Belzen, Matthias Ziegler, Florian Waldow
Current key foci of the Centre are to deal theoretically and empirically with research questions in the interdisciplinary context as well as to present the results of research to the efforts to improve education systems, education processes and teaching and learning material both in Germany and within international cooperation programs or organizations. Under this objective, a group of researchers from 30 member groups of the humanities, social sciences and natural science disciplines will develop and continually improve new, methodologically demanding forms of cooperation in complementary theoretical and methodological orientation. The Centre will intensively promote the qualification of young academics in the field of educational research, e.g. through the participation in structured doctoral programs, and the offer of teaching in the already established bachelor's and master's degree courses as well as in new training possibilities such as the professional scientific training.

Contribution to research networks

Since 2012, the Professional School of Education (PSE) and the IZBF have invited internationally renowned scientists to the Humboldt-Universität zu Berlin as part of the Biodiversity and public science "Fritz Karsen-Chairs".

This alliance will lead to the widest possible cooperation between the Fritz-Karsen-Chairs and various persons of the Humboldt-Universität zu Berlin involved in teacher education. All members of the IZBF and the PSE - such as students, young scholars and lecturers - shall profit from the activities of the guests. This can be reached by realizing joint research applications and projects, publications or seminars, but also by offering additional workshops and lectures.

List of Fritz Karsen-Chair:

Angela Brew, Macquarie University, 2017
Jan van den Akker, Universität Twente, 2017
Itesh Sachdev, (University of London), 2016

Integrative Research Institute of Life Sciences

ANDREAS HERRMANN
SPEAKER

<https://www.iri-ls.hu-berlin.de/en>

Description of the projects:

IRI Life Sciences was founded in 2013 by HU together with Charité and MDC as a mechanism for fostering collaborative, interdisciplinary basic research on medically relevant issues and for shaping the intellectual and structural environment of the HU's Campus Nord with the goal of stimulating self-supporting collaborative research programs. As a catalyst for these efforts, the founding institutions agreed to install and fund new research groups at the level of professors and independent young research group leaders, which together form the core of IRI Life Sciences. The aim of this scientific core, and the IRI as a whole, is to study complex biological systems using a mixture of quantitative experiments and theory. This scientific aim is promoted by common scientific interests, a commitment to open collaborations, and the shared use of equipment. These collaborations are facilitated by the fact that all three institutions lie in close physical proximity to one another, to the IRI core groups, and to the IRI office. The efforts are inspired by a long tradition of successful scientific collaboration between these institutions, in particular in the field of mathematical biology and Systems Biology since the late 1970's.

Institute for

Theoretical Biology (ITB)

HANSPETER HERZEL

Theoretical chronobiology

<https://itb.biologie.hu-berlin.de/wiki/groups/herzel/start>

Description of the projects:

The group was established within the Institute for Theoretical Biology (ITB) in 1996 and belongs to the Charité and the Humboldt University Berlin. We apply methods from dynamical systems, data analysis and bioinformatics to address biomedical questions. Examples are voice production, heart dynamics, DNA periodicities, gene regulation, T-cell differentiation and circadian rhythms.

1st symposium "Theoretical Chronobiology" on our campus in 2014.

Together with the experimental groups we investigate the generation and synchronization of circadian rhythms on different levels: (i) Modeling intracellular feedback regulation in the core clock oscillator (ii) Studying the entrainment, synchronization and splitting of SCN neurons (iii) Bioinformatic analysis (high-throughput data, promoter studies, epigenetics) of phase- and tissue specificity of clock-controlled genes (iv) Entrainment phase control based on oscillator theory.

Teaching mathematical modeling of gene regulation.

Selected publications:

Westermarck PO, Herzel H (2013) Mechanism for 12 hr rhythm generation by the circadian clock. Cell Reports, 3:1228-1238.

Abraham U, Granada A, Westermarck PO, Heine M, Kramer A, and Herzel H (2010) Coupling governs entrainment range of circadian clocks. Mol. Syst. Biol., 6:438.

Contribution to research networks

CRC/TR 186: Molecular Switches: Spatio-temporal Control of Cellular Signal Transmission. We study molecular switches for generation of circadian rhythms in mammals (with Achim Kramer) and in Neurospora (with Michael Brunner).

Research Training Group 1772: Computational Systems Biology. PhD students in this program apply bioinformatics and modeling to develop new theoretical concepts and their application to current and future problems in cell biology.

"German - USA Collaborations in Computational Neuroscience" Together with Erik Herzog (Washington University) we study the synchronization and entrainment of neurons in the suprachiasmatic nucleus.

List of Research Training Groups at Humboldt-Universität Berlin

Graduate Centre Life Sciences

<https://hu.berlin/lewi-docs>

The Graduate Centre Life Sciences is the central service facility for all current and prospective doctoral candidates at the Faculty of Life Sciences. It offers information on the admission to doctoral studies, further education, networking and counselling during the doctoral study period, as well as support for all doctoral students at the end of their doctoral degree programme.

GRADUATE CENTRE LIFE SCIENCES

The Graduate Centre Life Sciences is the contact point for all current and prospective doctoral candidates at Humboldt-Universität zu Berlin in Agricultural Science, Biology, Biophysics, Horticultural Science and Psychology.

The further education courses offered by the Graduate Centre Life Sciences are primarily targeted at doctoral candidates who are not enrolled in a structured doctoral degree programme. At the same time, the Graduate Centre is the networking point for all doctoral degree programmes and their doctoral candidates at our Faculty. In this way, the Graduate Centre Life Sciences promotes networking between all doctoral candidates at the Faculty of Life Sciences.

DFG-Research Training Groups - with Humboldt-Universität as co-ordinator

GRK 1772: Computational Systems Biology

<http://www.berlin-csb.de/>

Patterns in the relationship of the structure, dynamics and function of biological systems are investigated in this group. Its work is aimed at developing new theoretical concepts and their application to current problems of cellular biology. It is to contribute to a better understanding of biological phenomena and processes. At the same time the interpretation of biological data is to be further improved and the development of new experimental and practice related research strategies to be promoted.

IRTG 2290: Crossing Boundaries: Molecular Interactions in Malaria

<https://www.allianceberlinanberra.org/>

Malaria is caused by single-celled parasites known as Plasmodium, which are transmitted by the bite of the Anopheles mosquito. Some basic principles of the progress of the disease and parasite-host interactions are still not understood. The German-Australian International Research Training Group "Crossing Boundaries: Molecular Interactions in Malaria" will therefore investigate the molecular mechanisms of Plasmodium infections as a basis for strategies to develop new drugs and immunisations for improved malaria treatment and prevention.

DFG-Research Training Groups - Humboldt Contributions

GRK 1589: Sensory computation in neural systems

<http://www.bccn-berlin.de/Graduate+Programs/?languageId=1>

Computational Neuroscience is a relatively recent field of research which is well known for its interdisciplinary approach. It is a field in which experimental neuroscientists cooperate with theoreticians in order to reach a better understanding of the functional principles of the brain. Hypotheses concerning neural systems are translated into mathematical language and then tested in computer simulations. Applications of the procedure range from an improved treatment of neuronal disorders through the brain computer interface up to the development of neuro-prostheses and intelligent machines and robots.

GRK 2046: Parasite Infections: From Experimental Models To Natural Systems

<http://www.vetmed.fu-berlin.de/en/einrichtungen/sonstige/grk2046/index.html>

With a steady increase due to drug resistance, global warming and increasing international travel, parasitic diseases are distributed worldwide in human and animal populations. The RTG aims to install a cutting edge and integrative curriculum to educate "next-generation" parasitologists. In an interdisciplinary approach, graduates are trained in molecular approaches, cellular interactions and organismic studies on key parasites of model organisms, free-ranging animals and humans. The research topics focus on four parasite groups: Plasmodium, Toxoplasma, Giardia and helminths. In accordance with the "One Health" concept the different parasite infections are studied from the biological, medical, and translational perspectives.

Concluded doctoral theses

2016

(in total): 109 concluded doctoral theses
of
38 in the institute of biology
26 in the Charité
21 in the Max-Delbrück-Centrum
4 in the DRFZ
6 in the Museum für Naturkunde
14 Other

of
62% Women
38 % Men

German citizens 76%
Different citizens 24% (from 15 Nations)

2015

(in total): 125 concluded doctoral theses
of
49 in the institute of biology
26 in the Charité
20 in the Max-Delbrück-Centrum
10 in the DRFZ
20 Other

of
64% Women
36% Men

German citizens 70%
Different citizens 30% (from 24 Nations)

Appendix 9

Student council (FSI) at the Department of Biology (IfB)

<https://fachschaften.hu-berlin.de/de/fsbio>

Description of the projects:

The FSI Biology consists of voluntary members from the bachelor and master program in biology and biophysics who have not been elected. Our goals are to promote and improve communication between students and professors, working groups and academic administration, to simplify the beginning of the study for new students and to provide a platform for exchange regarding matters of university politics, science and social life. Therefore, FSI members participate in various committees of department and faculty, where they support the concerns and needs of students and, to do so in an efficient and successful way, try to communicate with the students as much as possible. Besides, the FSI organises the weekend trips, the first organisational lectures and a tour around the campus for new students as well as various events in collaboration with students from other programs in the faculty.

Dies Academicus

The FSI allows students to take immediate influence on university politics and education. Student representatives, together with professors and scientific employees, are part of the committee for teaching and learning (“Kommission für Lehre und Studium” = KLS), where study regulations are being written and discussions on problems with study programs are enabled. Furthermore, both the department board and faculty committee involve student representatives who advocate students’ rights and interests at the department.

To facilitate networking and communication within the faculty, students of all three departments (Albrecht Daniel Thaer-Institute of agricultural and horticultural sciences, department of psychology and department of biology) manage together the student café, which welcomes students from every program within the faculty to relax and chat and is the location for many events.

All students are welcomed to join our weekly meeting. Place and time for each semester can be found on our website (<https://fachschaften.hu-berlin.de/de/fsbio>). If you have problems affecting a wider range of students, ideas and suggestions or questions about university politics, events, participation and more, please feel free to contact us (fsbio.hu-berlin@gmail.com).

AFM	Atomic Force Microscopy	cGMP	Cyclic guanosine monophosphate	HSC	Hematopoietic stem cells
ATT	Adoptive T cell therapy	ChRs	Channelrhodopsins	ICCN	Interdisciplinary Center Computational Neuroscience
BAC firing	Simulation of Backpropagation Activated Calcium spike	CoCCoN	Cooperation and Collective Cognition Network	IRI	Integrative Research Institutes
BBiB	Berlin-Brandenburg Institute of Advanced Biodiversity Research	CT	Computed tomography	ISI	Institute of Scientific Interchange
BCCN	Bernstein Center for Computational Neuroscience	CRC	Collaborative Research Center	ITB	Institute of Theoretical Biology
BESSY II	BESSY II offers extremely brilliant synchrotron light pulses in the terahertz range to the visible spectrum all the way to hard X-rays, with an emphasis on the soft X-ray range. At each of the beamlines' experimental stations, researchers are able to adjust wavelength, polarization, and photon energy so as to examine their samples at spatial resolutions in the nanometer range (10^{-9} meters). In addition, the ultrashort light pulses offer insights into the dynamics of ultrafast reactions in the femtosecond range (10^{-15} seconds).	DFG	German Research Foundation	KoKoHs	Modeling and Measuring Competencies in Higher Education – Validation and Methodological Innovations
		DNA	Deoxyribonucleic acid		
		DZNE	German Center for Neurodegenerative Diseases	Ko-WADis	Evaluating the development of scientific literacy in teacher education
		ECF	Energy-coupling factor	LVB	Leibniz-Verbund Biodiversität
		EC	Cluster of Excellence	MDC	Max Delbrück Center for Molecular Medicine in the Helmholtz Association
		ECSA	European Citizen Science Association	MPP	Multi-potential progenitors
		ERC	European Research Council	NICO	Northwestern Institute on Complex Systems
BIBS	Bridging in Biodiversity Science	EU	European Union	ProMINTion	The Graduate School "ProMINTion" is part of the Humboldt-ProMINT-Kolleg, an interdisciplinary institution for teacher education in mathematics, informatics and the natural sciences at Humboldt-Universität zu Berlin.
BIH	Berlin Institute of Health	FTIR	Fourier-transform infrared spectroscopy
